Preface

Company Profile

Founded in 2014, Shenzhen Lonten Technology Co., Ltd. focuses on the design, research production of Electronics Module for robotics related products. Consisting of professional researchers and skilled engineers, our R&D team constantly strives for creative function and excellent user experience. The company's R&D investments on arduino kits raspberry pi kits, as well as 3D printer and robots that back up STEAM education.

Customer Service

Our self-owned factory is certificated with BSCI and SO, covering an area of 5,000 square meters, and achieving an annual production capacity of over 10,000 units. Our products are all certified to CE, FCC, and ROHS standards, have exported to more than 100 countries including, but not limited to France, the United States of America, Australia, Russia, the United Kingdom, Germany, Singapore, Egypt, and India, bringing technological innovation to all walks of life.

Tutorial

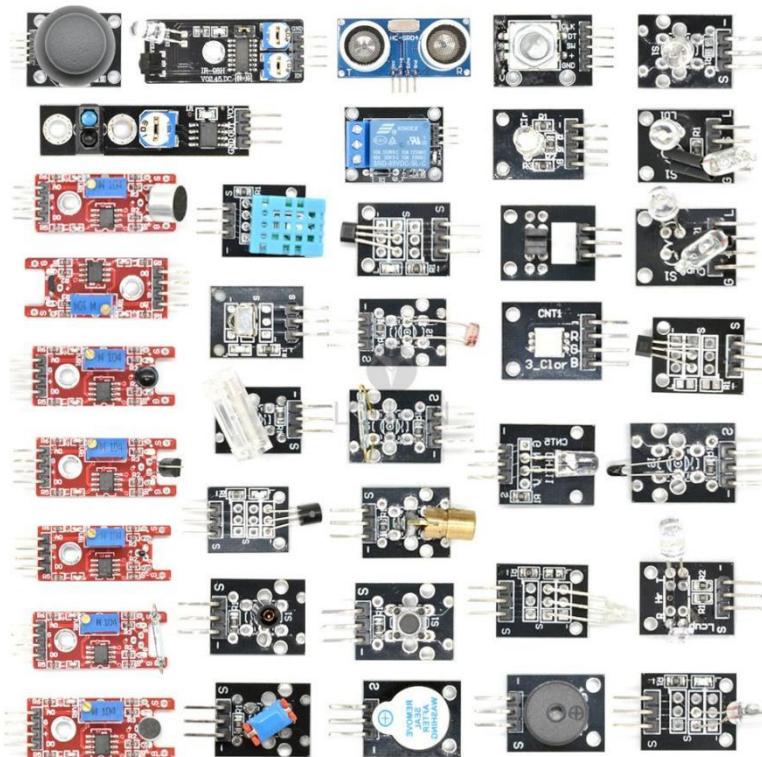

This tutorial include codes, libraries and detailed user documentation. It is designed for beginners. You will learn all the basic knowledge about how to use Arduino controller board, sensors and components.

LROBRYA

Kit Introduction

This is a 38 in 1 sensor learning kit for Arduino, rolled out by LONTEN.

Inside this kit are digital/analog sensors, as well as some special modules such as ultrasonic module, joystick, relay module and acceleration modules, etc.

For each module, we provide a clear connection diagram and a sample code.

Although you are a beginner, you can readily pick up how sensors work.

The sample codes for this sensor kit

are based on Arduino. In addition, you have an alternative to apply this kit to other MCU development platform, such as 51, STM32, Raspberries Pi since the working principle is almost same.

Now, let's start from the basic lessons.

How to Install Arduino IDE

Introduction

The Arduino Integrated Development Environment (IDE) is the software side of the Arduino platform.

In this Project, you will learn how to setup your computer to use Arduino and how to set about the Projects that follow.

The Arduino software that you will use to program your Arduino is available for Windows, Mac and Linux. The installation process is different for all three platforms and unfortunately there is a certain amount of manual work to install the software.

STEP 1: Go to <https://www.arduino.cc/en/software>.

The screenshot shows the Arduino IDE 2.1.1 download page. On the left, there is a teal rounded square icon with a white infinity symbol and a plus sign. To its right, the text "Arduino IDE 2.1.1" is displayed. Below this, a paragraph of text describes the new features of the IDE. Further down, there is a link to "Arduino IDE 2.0 documentation" and a note about nightly builds. At the bottom, there is a "SOURCE CODE" link and a note about the source code being hosted on GitHub. On the right side, a teal sidebar titled "DOWNLOAD OPTIONS" provides links for Windows (Win 10 and newer, 64 bits, MSI installer, ZIP file), Linux (AppImage 64 bits (X86-64), ZIP file 64 bits (X86-64)), and macOS (Intel, 10.14: "Mojave" or newer, 64 bits, Apple Silicon, 11: "Big Sur" or newer, 64 bits). A "Release Notes" link is also present.

The version available at this website is usually the latest version, and the actual version may be newer than the version in the picture.

LROBRYA

STEP2: Download the development software that is compatible with the operating.

system of your computer. Take Windows as an example here.

Click Windows Win 10 and newer, 64 bits.

Click JUST DOWNLOAD.

LROBRUYA

Also version 2.1.1 is available in the material we provided, and the versions of our materials are the latest versions when this course was made.

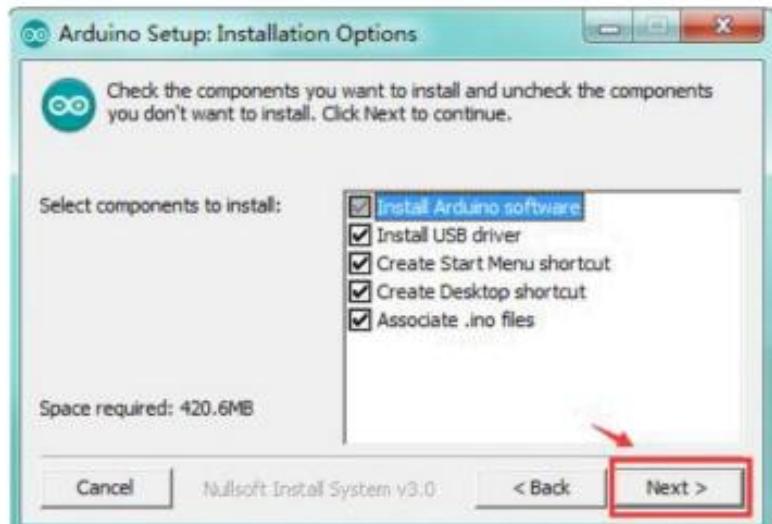

Installing Arduino (Windows)

Install Arduino with the exe. Installation package.

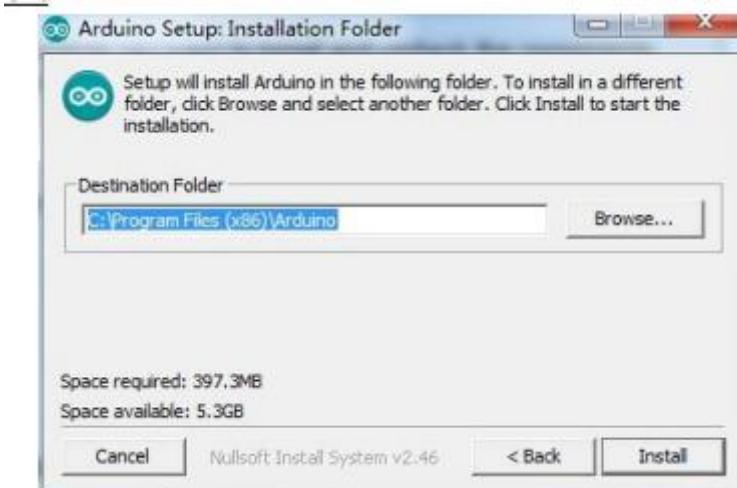

Click I Agree to see the following interface.

LROBRUYA

Click Next

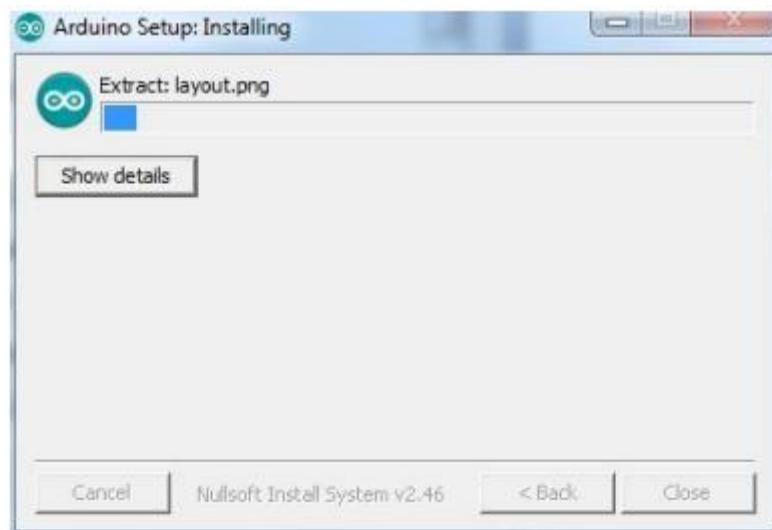

You can press **Browse...** to choose an installation path or directly type in the directory you want.

LROBRUYA

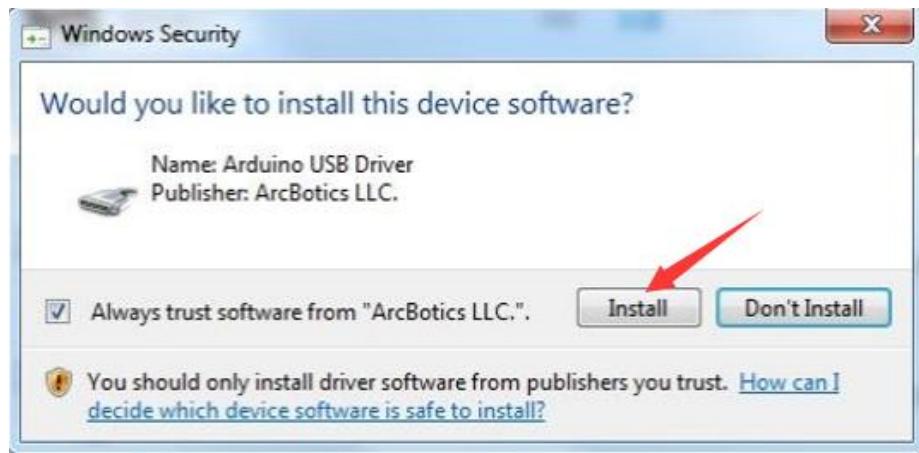

Click Install to initiate installation

Finally, the following interface appears, click Install to finish the installation.

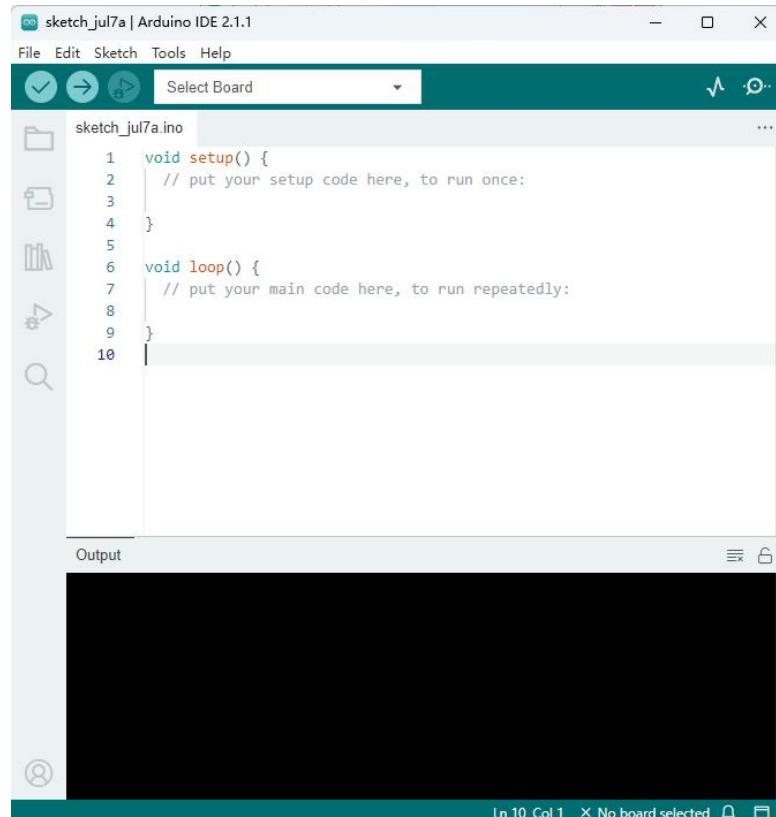

LROBRUYA

Next, the following icon appears on the desktop

Double-click to enter the desired development environment

You may directly choose the installation package for installation and

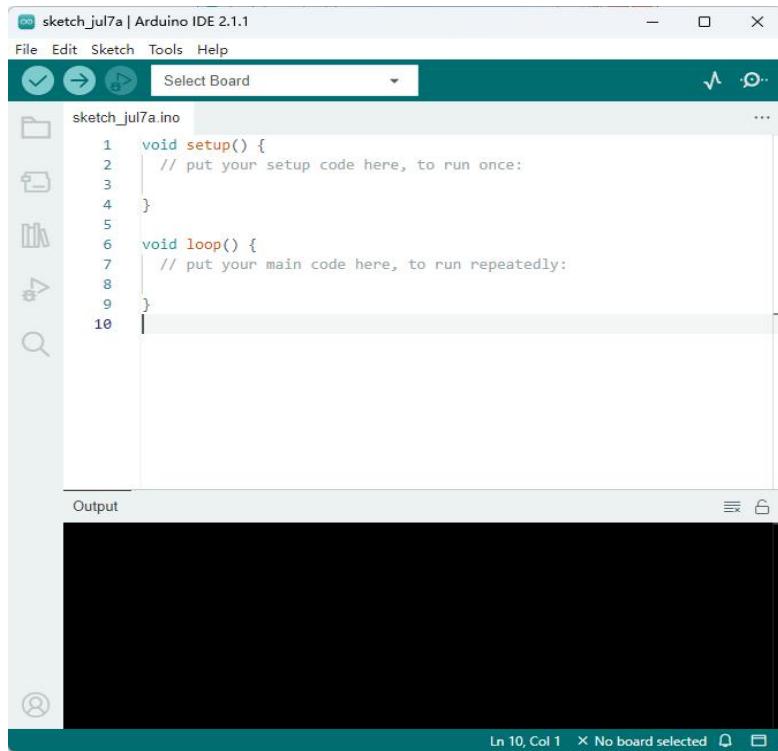

LROBRYA

skip the contents below and jump to the next section. But if you want to learn some methods other than the installation package, please continue to read the section.

Unzip the zip file downloaded, Double-click to open the program and enter the desired development environment.

LROBRUYA

How to Install Arduino Driver

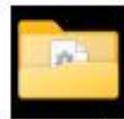

For Windows

Arduino UNO

The USB to serial port chip of this control board is CH340G. So you need to install the driver for the chip. You can click the driver file here. In different systems, the driver installation is similar. Here we start to install the driver on the Win10 system. You can find the “USB_Drive_CH341_3_1” folder in the information we provide, this is the driver file we want to install.

LROBRUYA

USB_Drive
_CH341_3_
1_For_Win
dows

Plug one end of your USB cable into the Arduino UNO CH340 Board

and the other into a USB socket on your computer.

When you connect the Arduino UNO CH340 Board to your computer at

the first time, right click your “My Computer”—>for

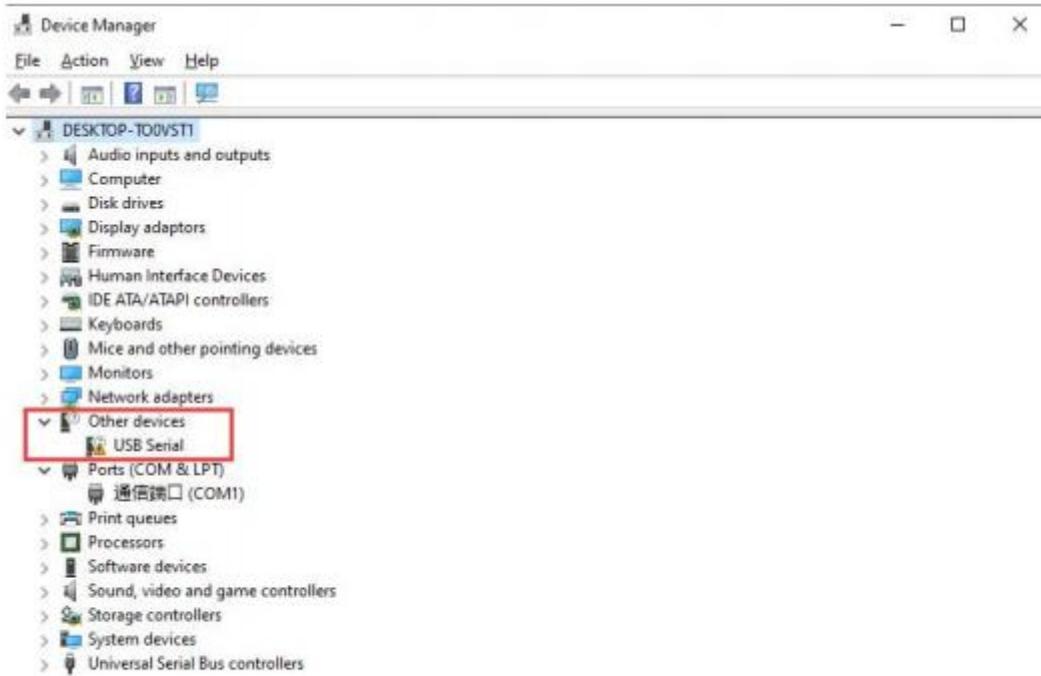

“Properties”—>click the “Device manager”, under Other devices, you

should see the “USB-Serial” or “Unknown device ”.Or you can search for

“devi” in your computer, or you can open the device manager of your

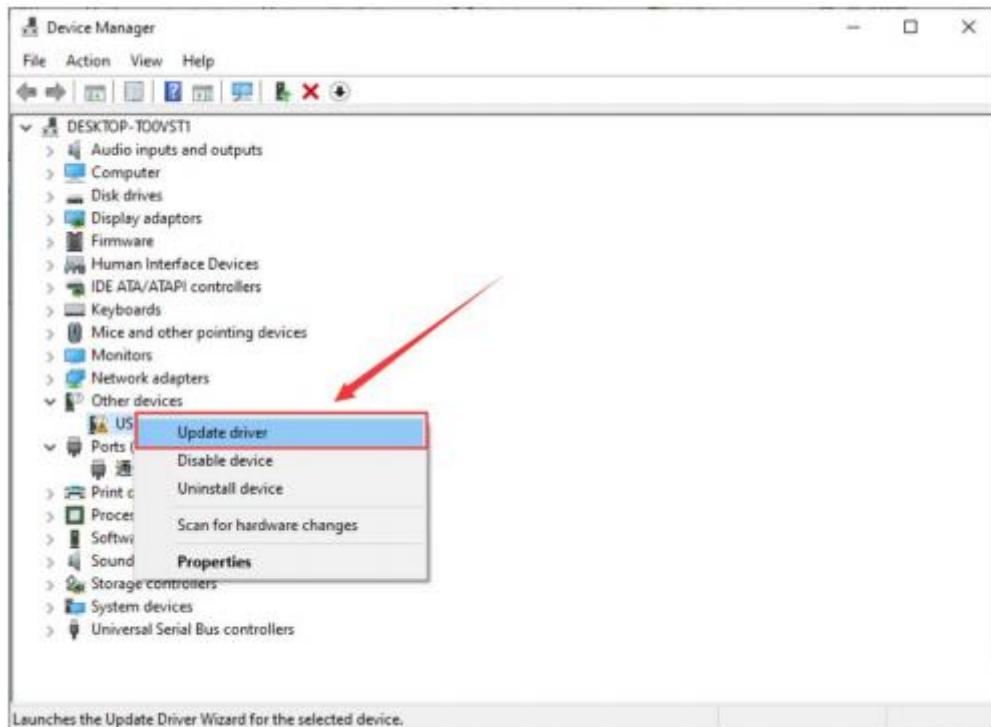

computer.

LROBRUYA

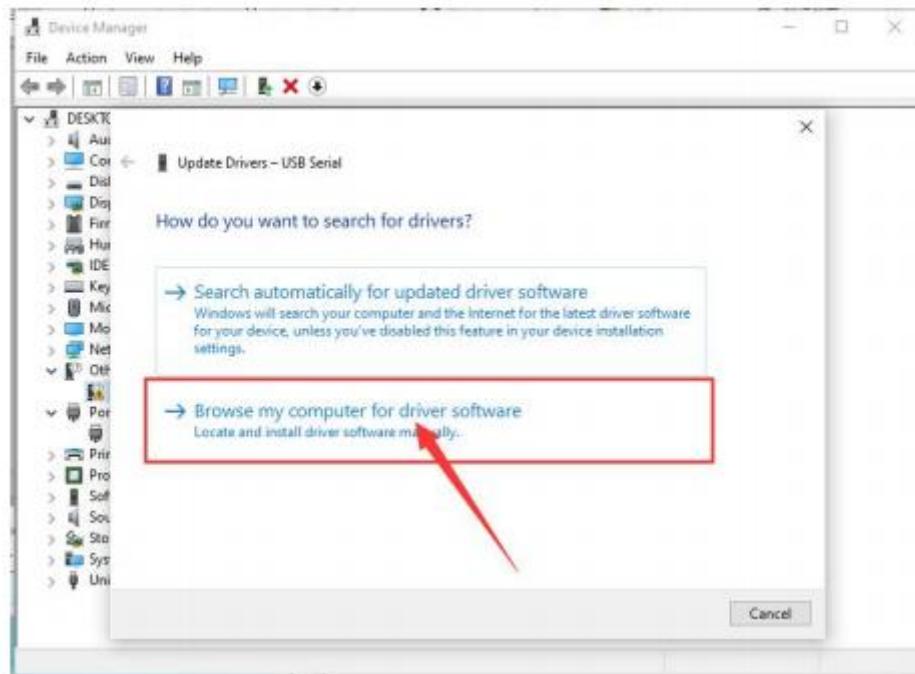

Then right-click on the device and select the top menu option (Update Driver Software...) shown as the figure below.

LROBRUYA

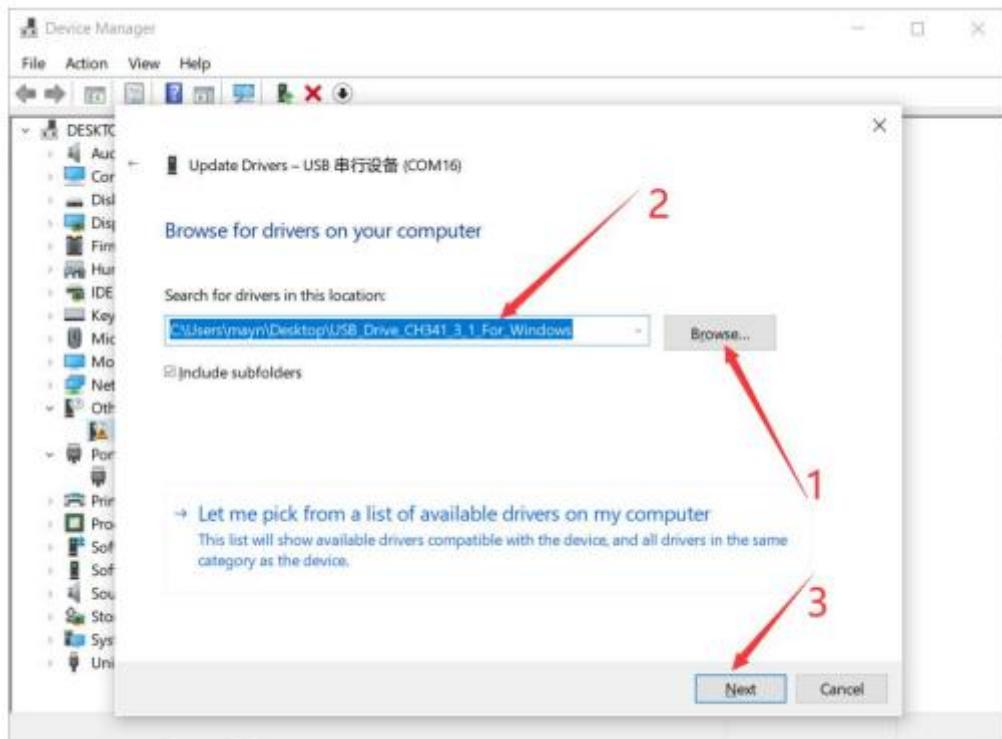

Then it will be prompted to either “Search Automatically for updated driver software” or “Browse my computer for driver software”. Shown as below. In this page, select “Browse my computer for driver software”.

LROBRUYA

After that, select the browse option and navigate to the drive folder "USB_Drive_CH341_3_1", which can be found in the information we provide. (Note that the file path selects the location of the .For example, I store this driver file on the computer desktop, so the file path I choose is `C:\Users\mayn\Desktop\USB_Drive_CH341_3_1_For_Windows`)

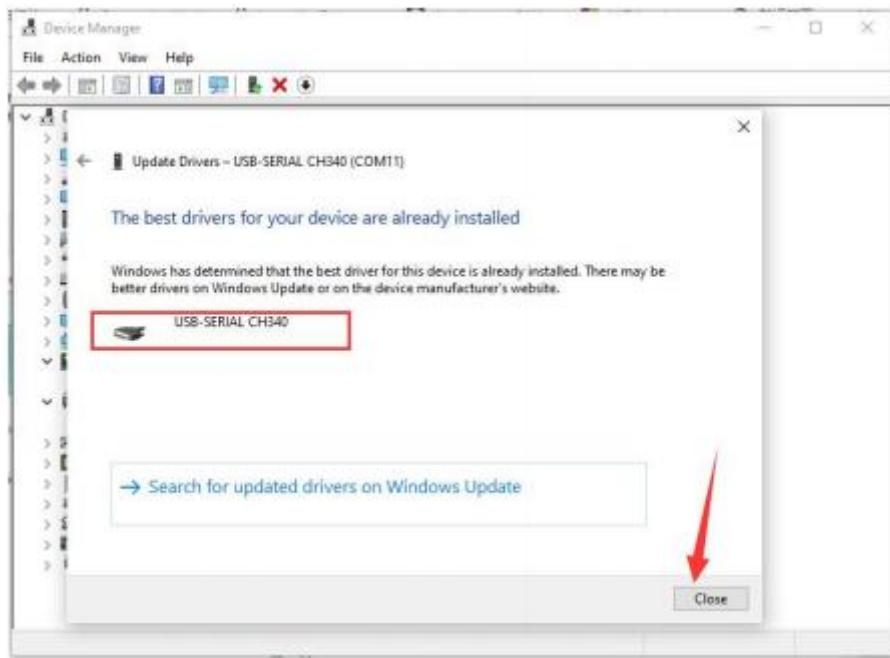

LROBRUYA

Once the software has been installed, you will get a confirmation message.

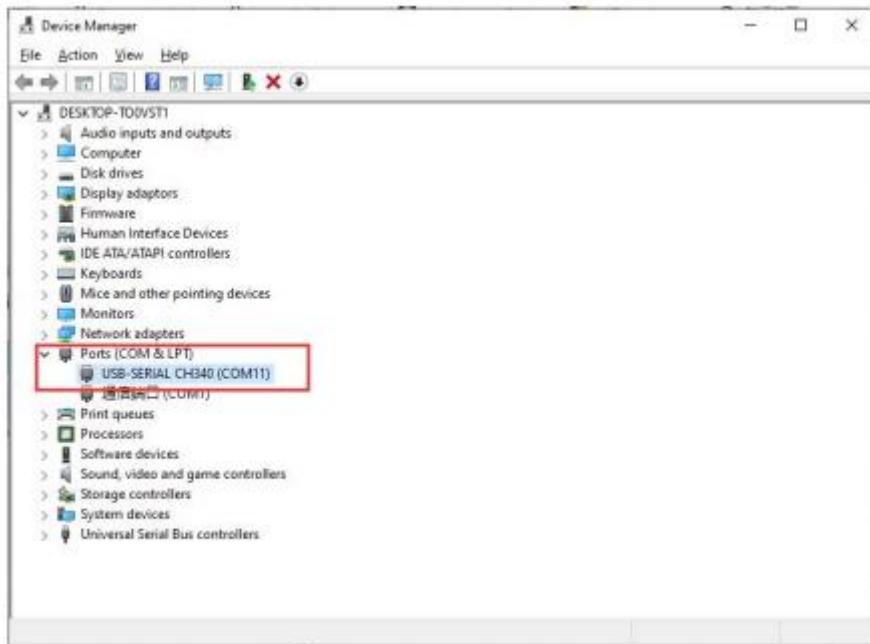

Installation completed, click “Close”.

LROBRUYA

Up to now, the driver is installed well. Then you can right click "My Computer" —> for "Properties" —> click the "Device manager", you should see the device as the figure shown below. Or you can search for "devi" in your computer, or you can open the device manager of your computer.

LROBRUYA

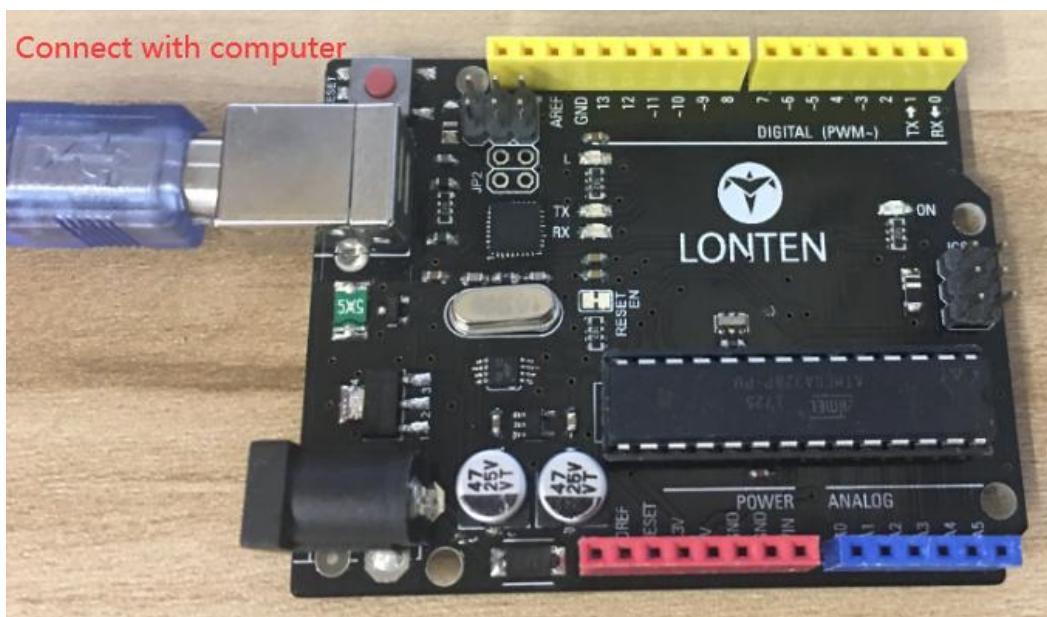

For MAC System

Arduino UNO

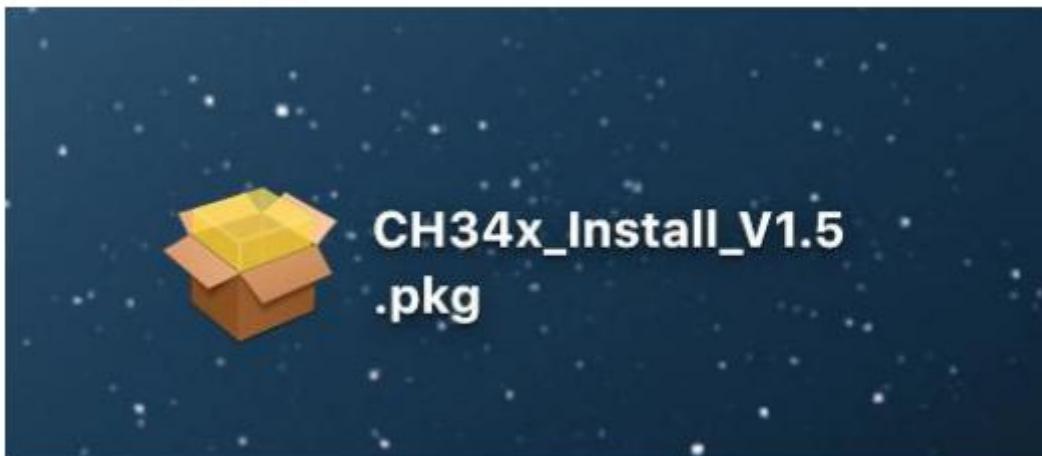

Plug one end of your USB cable into the Arduino UNO CH340 Board

and the other into a USB socket on your computer.

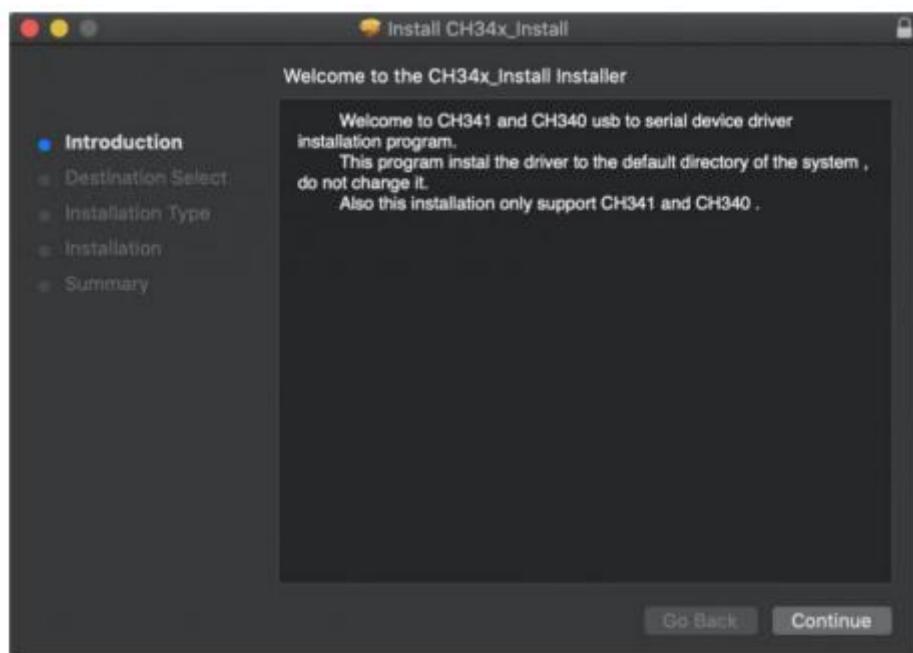

LROBRUYA

The driver file of the CH340G of the MAC system is provided in the tutorial data package.

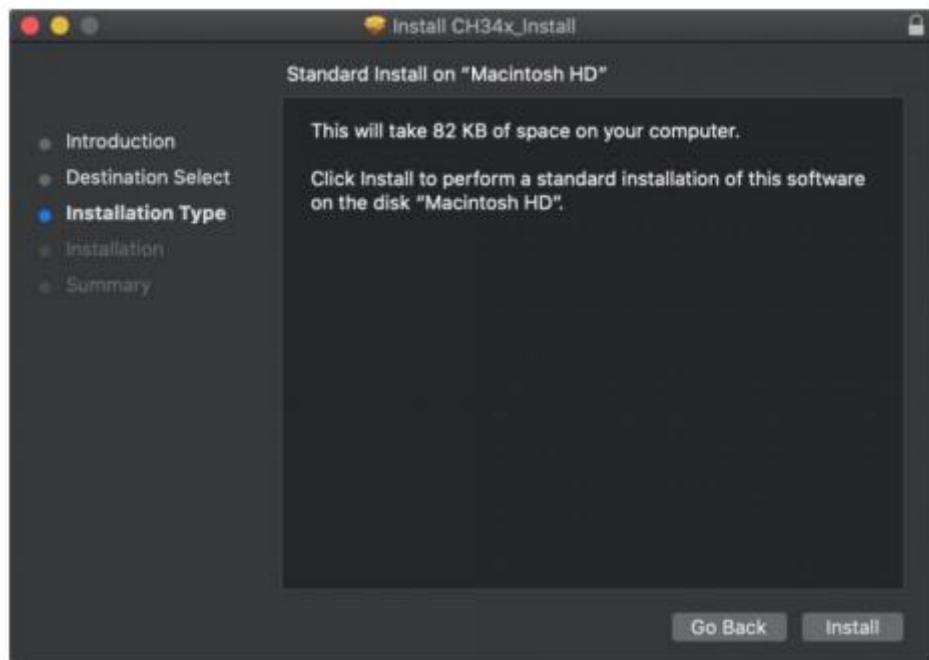

Double-click installation package and tap Continue

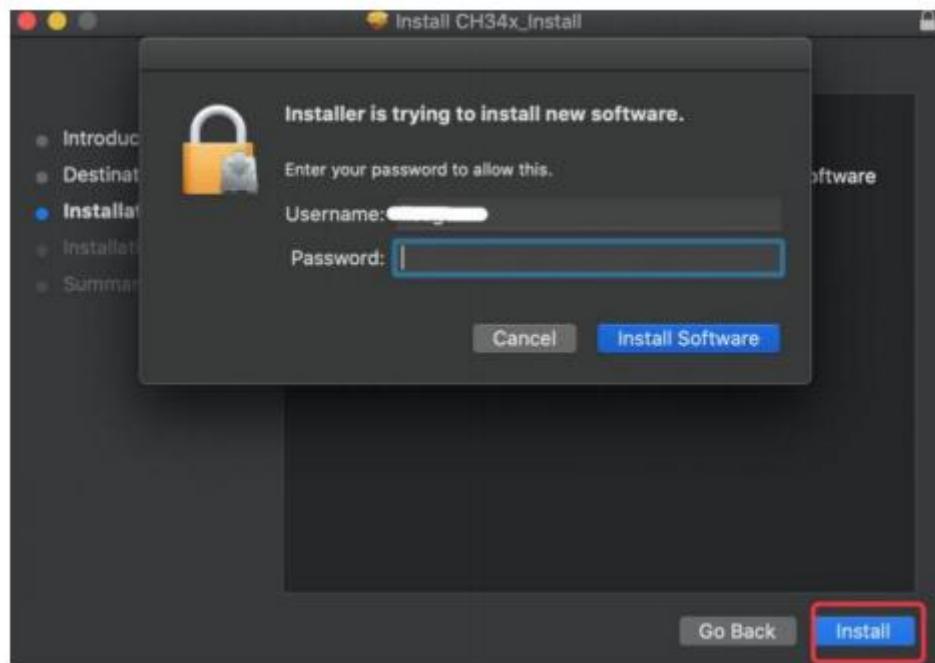

Click Install

LROBRUYA

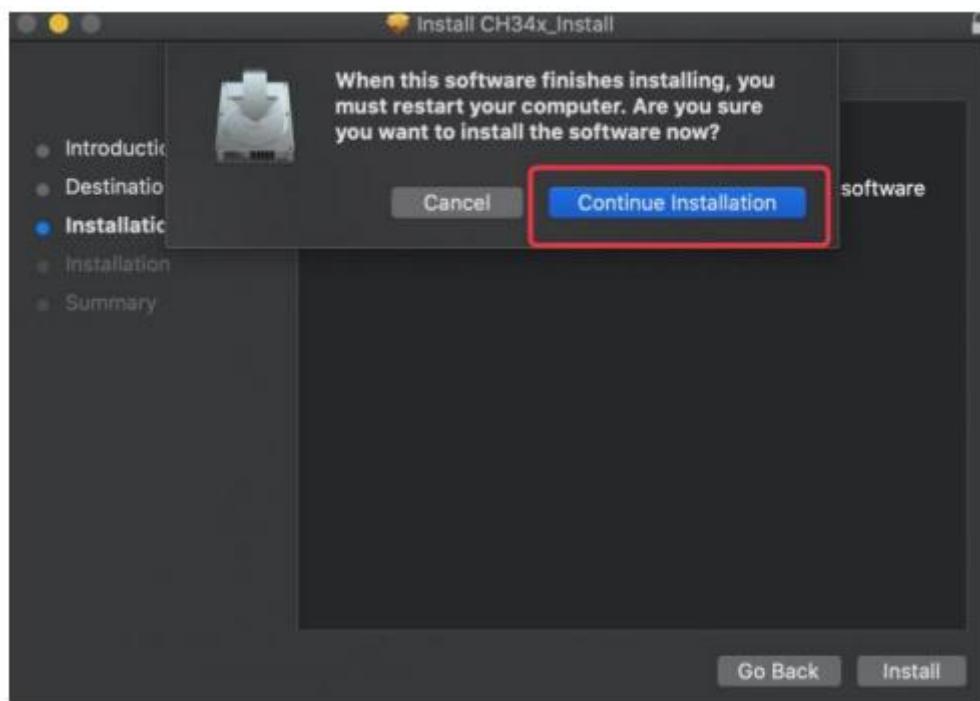

Input your user password and click Install Software

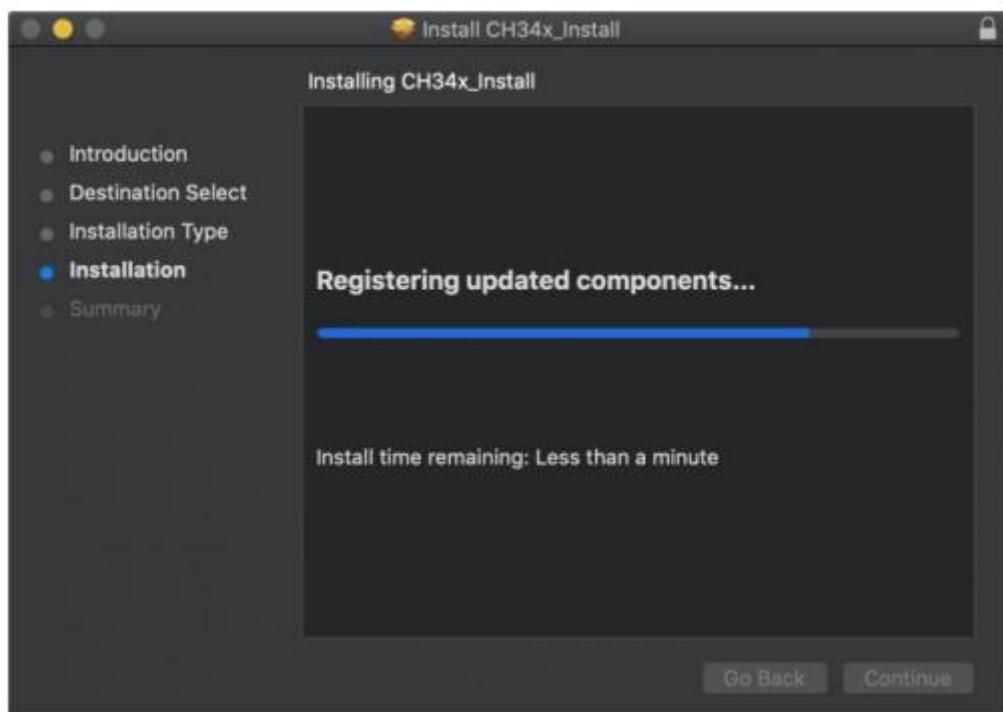

Tap Continue Installation

LROBRUYA

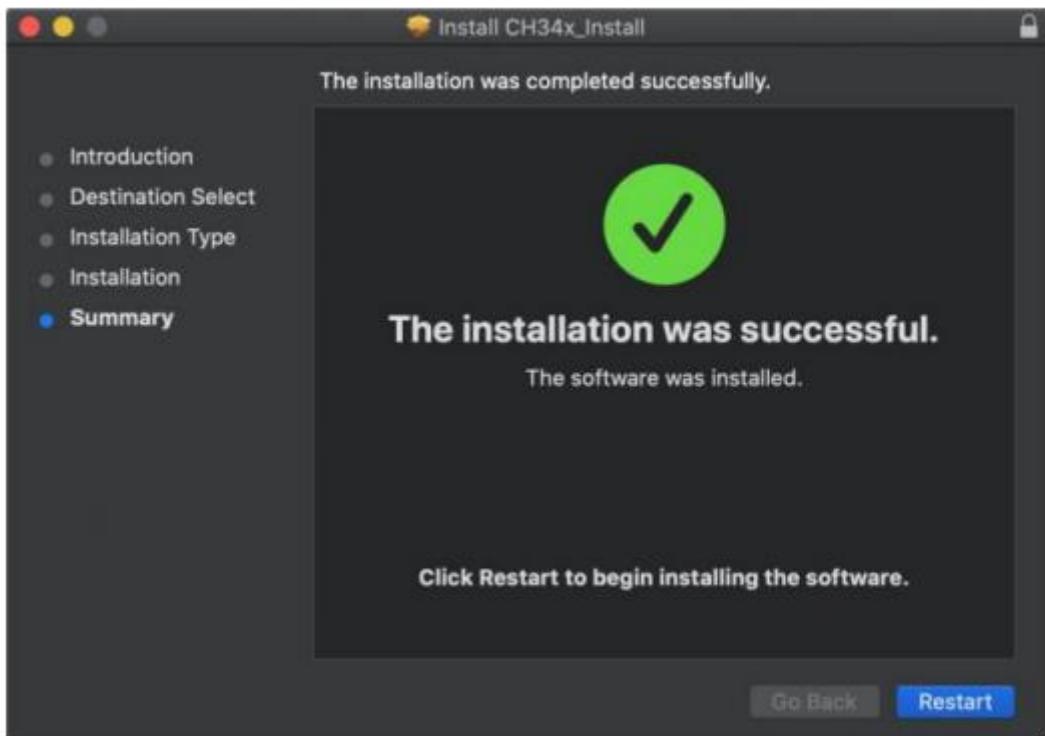

Wait to install

Click Restart after the installation is finished

LROBRUYA

How to Add Arduino Libraries

Installing Additional Arduino Libraries

Once you are comfortable with the Arduino software and using the built-in functions, you may want to extend the ability of your Arduino with additional libraries.

What are Libraries?

Libraries are a collection of code that makes it easy for you to connect to a sensor, display, module, etc. For example, the built-in Liquid Crystal library makes it easy to talk to character LCD displays. There are

LROBRYA

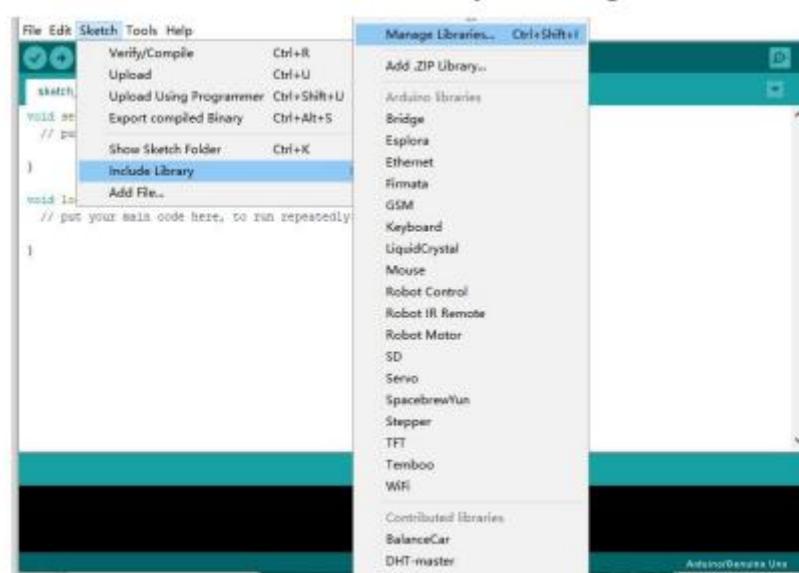

hundreds of additional libraries available on the Internet for download.

The built-in libraries and some of these additional libraries are listed in the reference. To use the additional libraries, you will need to install them.

How to Install a Library

Using the Library Manager

To install a new library into your Arduino IDE you can use the Library Manager (available from IDE version 1.8.0). Open the IDE and click to the "Sketch" menu and then Include Library > Manage Libraries.

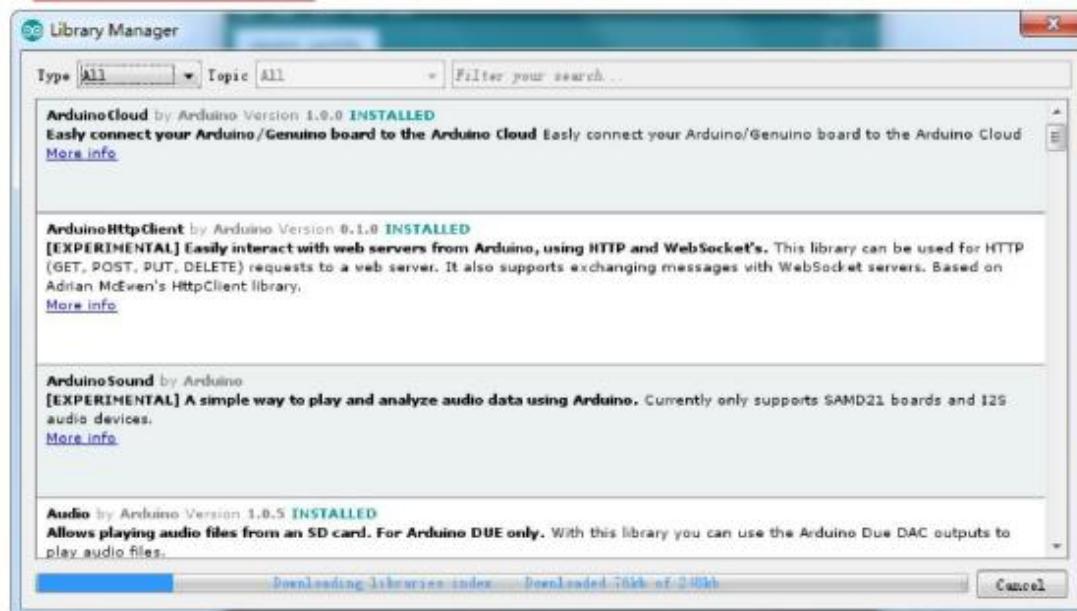

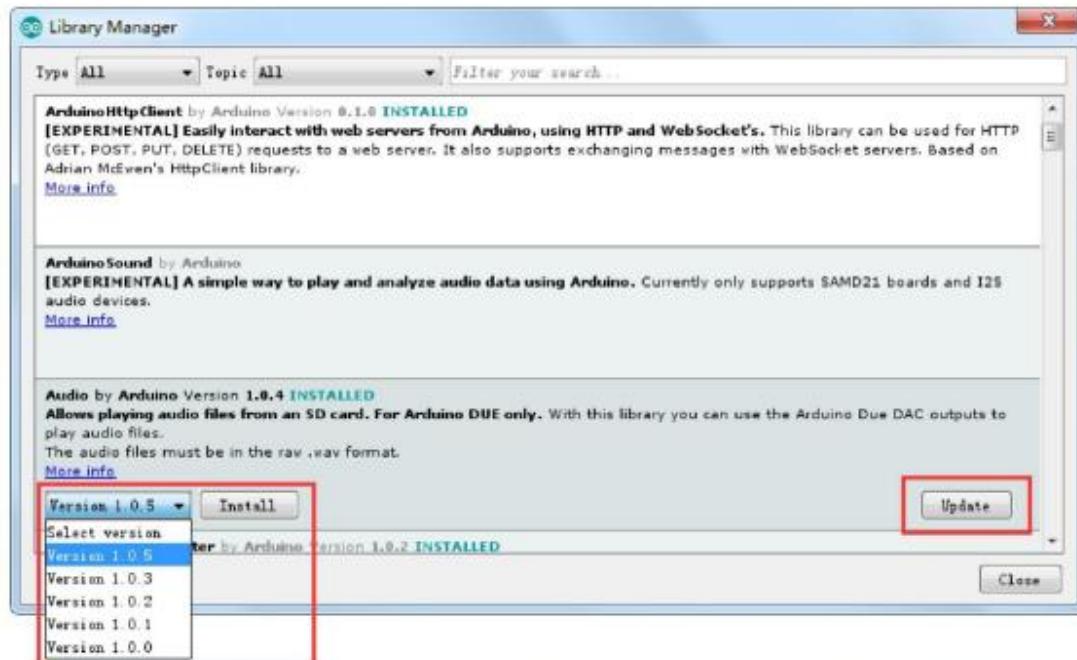

Then the library manager will open and you will find a list of libraries that are already installed or ready for installation. In this example we will install the Bridge library. Scroll the list to find it, then select the version of the library you want to install. Sometimes only one version of the

LROBRUYA

library is available. If the version selection menu does not appear, don't worry: it is normal.

There are times you have to be patient with it, just as shown in the figure. Please refresh it and wait.

Finally click on install and wait for the IDE to install the new library.

LROBRYA

Downloading may take time depending on your connection speed. Once it has finished, an Installed tag should appear next to the Bridge library. You can close the library manager.

You can now find the new library available in the Include Library menu.

If you want to add your own library open a new issue on [Github](#).

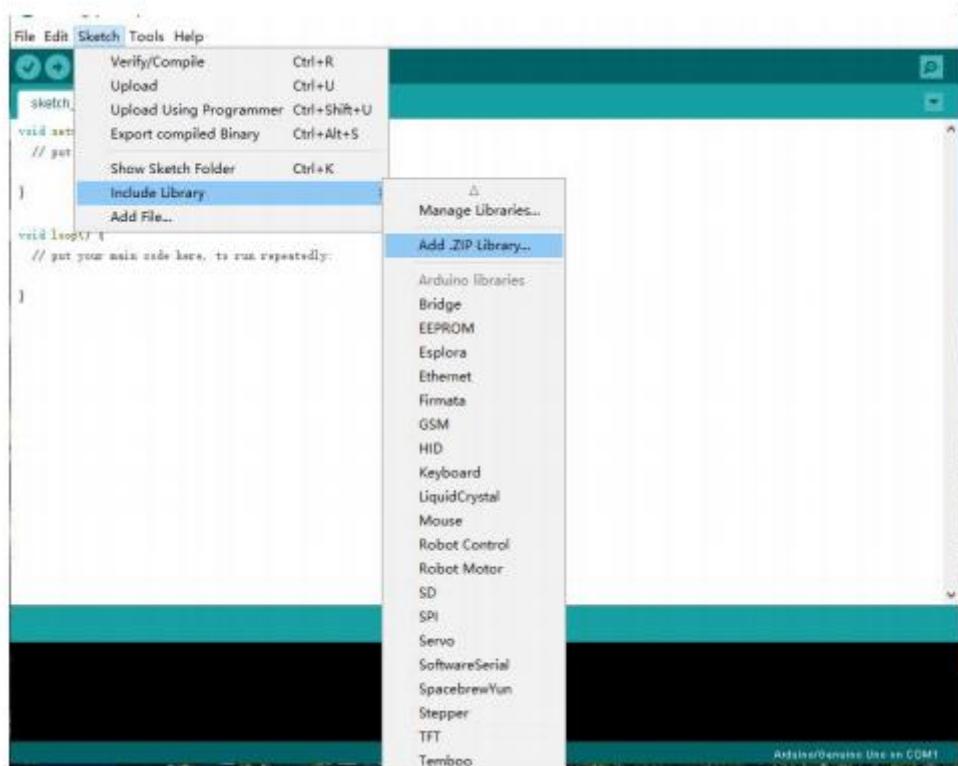

Importing a .zip Library

Libraries are often distributed as a ZIP file or folder. The name of the folder is the name of the library. Inside the folder will be a .cpp file, a .h file and often a keywords.txt file, examples folder, and other files required by the library. Starting with version 1.0.5, you can install 3rd party libraries in the IDE. Do not unzip the downloaded library, leave it as is.

In the Arduino IDE, navigate to Sketch > Include Library. At the top of

LROBRUYA

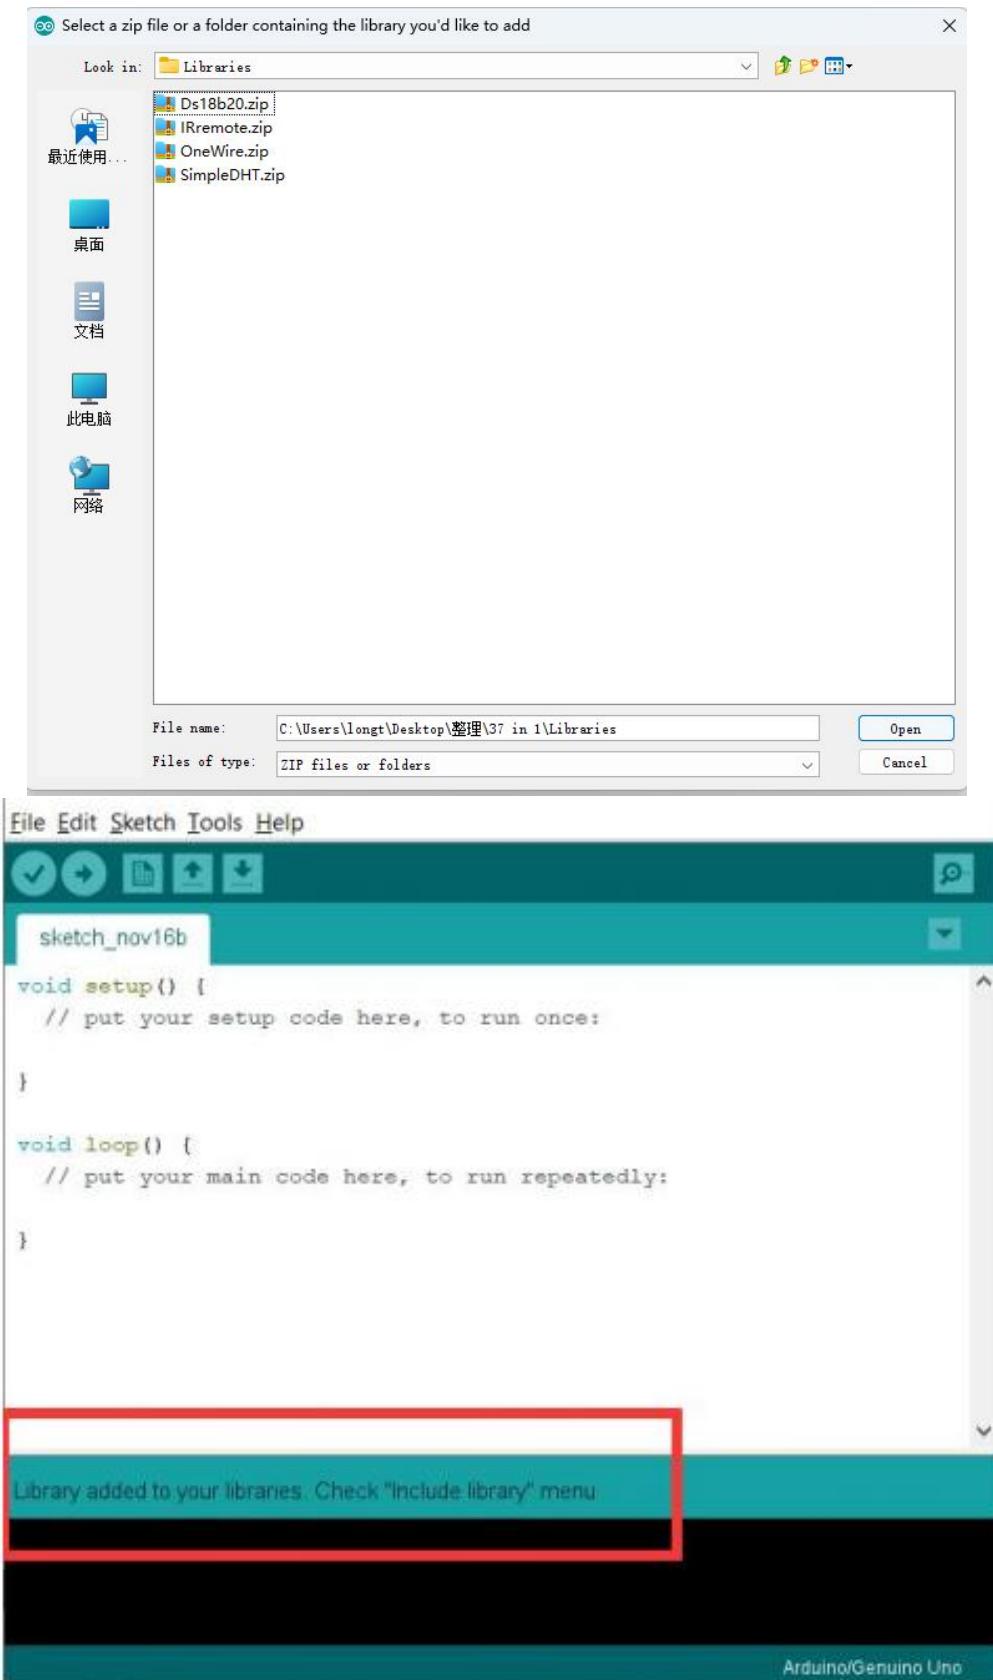

the drop down list, select the option to "Add .ZIP Library".

You will be prompted to select the library you would like to add.

Navigate to the .zip file's location and open it.

LROBRUYA

Return to the Sketch > Import Library menu. You should now see the library at the bottom of the drop-down menu. It is ready to be used in your sketch. The zip file will have been expanded in the libraries folder in your Arduino sketches directory. **NB: the Library will be available to use in sketches, but examples for the library will not be exposed in the File > Examples until after the IDE has restarted.**

Blink Test

Overview

In this Project, you will learn how to program your UNO R3 controller board to blink the Arduino's built-in LED, and how to download programs by basic steps.

Component Required:

LONTEN Uno R3 Board* 1

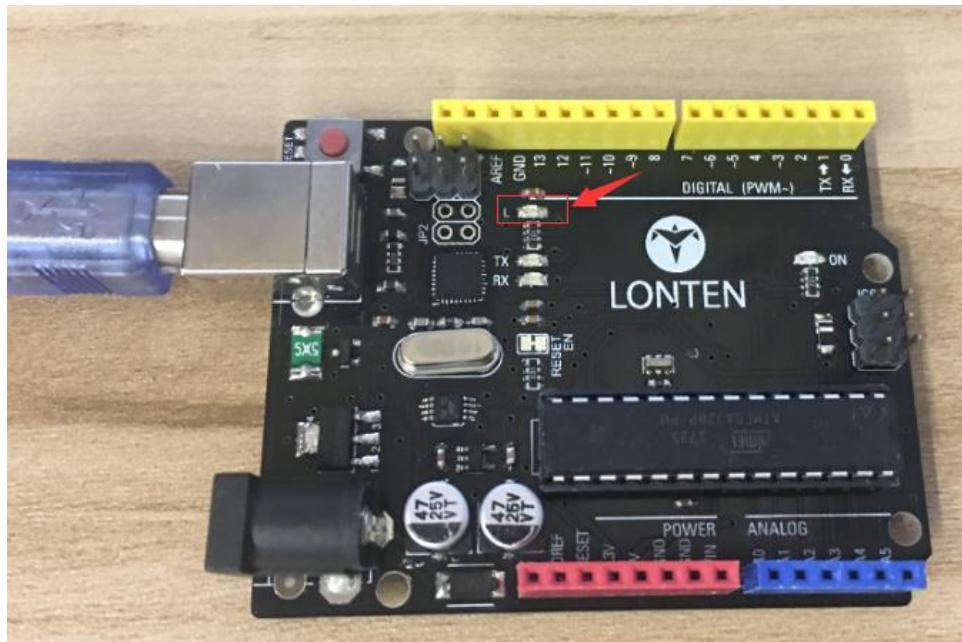

Principle

The UNO R3 board has rows of connectors along both sides that are used to connect to several electronic devices and plug-in 'shields' that extends its capability.

It also has a single LED that you can control from your sketches. This LED is built onto the UNO R3 board and is often referred to as the 'L'

LROBRYA

LED as this is how it is labeled on the board.

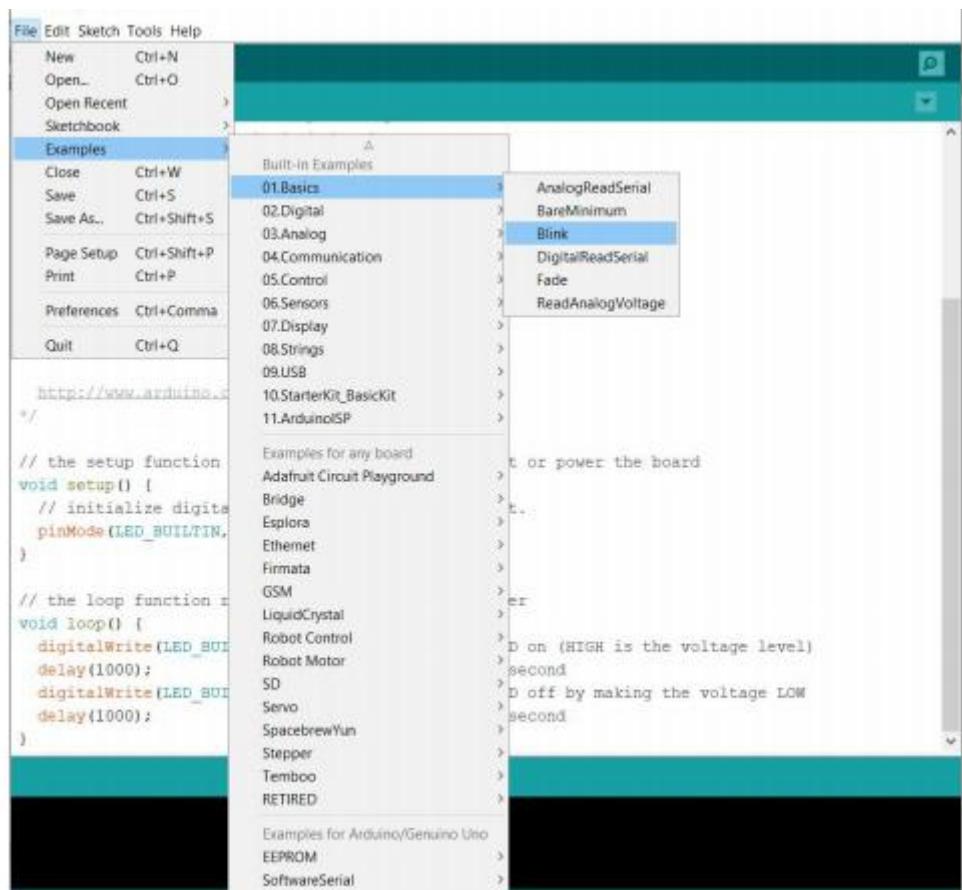

In this Project, we will reprogram the UNO board with our own Blink sketch and then change the rate at which it blinks.

In the previous chapter-How to install Arduino IDE, you set up your Arduino IDE and made sure that you could find the right serial port for it to connect to your UNO board. The time has now come to put that connection to the test and program your UNO board.

The Arduino IDE includes a large collection of example sketches that you can load up and use. This includes an example sketch for making the 'L' LED blink.

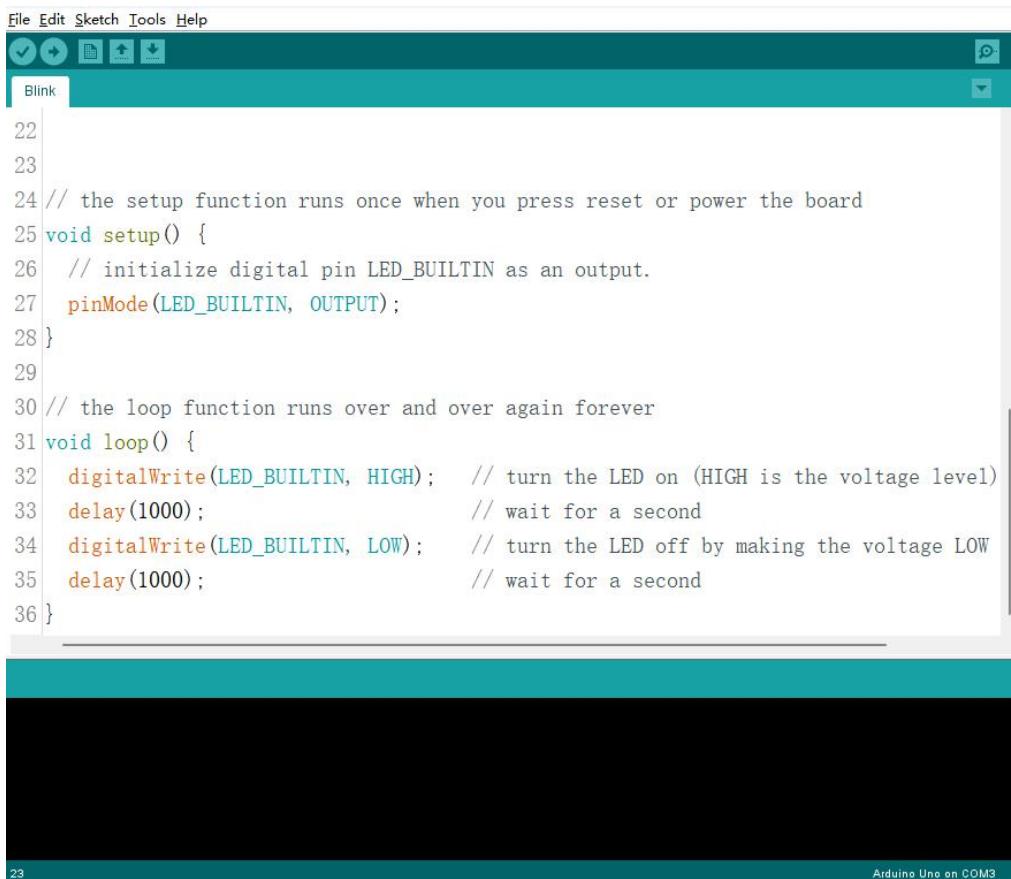

Load the 'Blink' sketch that you will find in the IDE's menu system under File > Examples > 01.Basics > Blink

LROBRUYA

When the sketch window opens, enlarge it so that you can see the entire sketch in the window.

LROBRYA

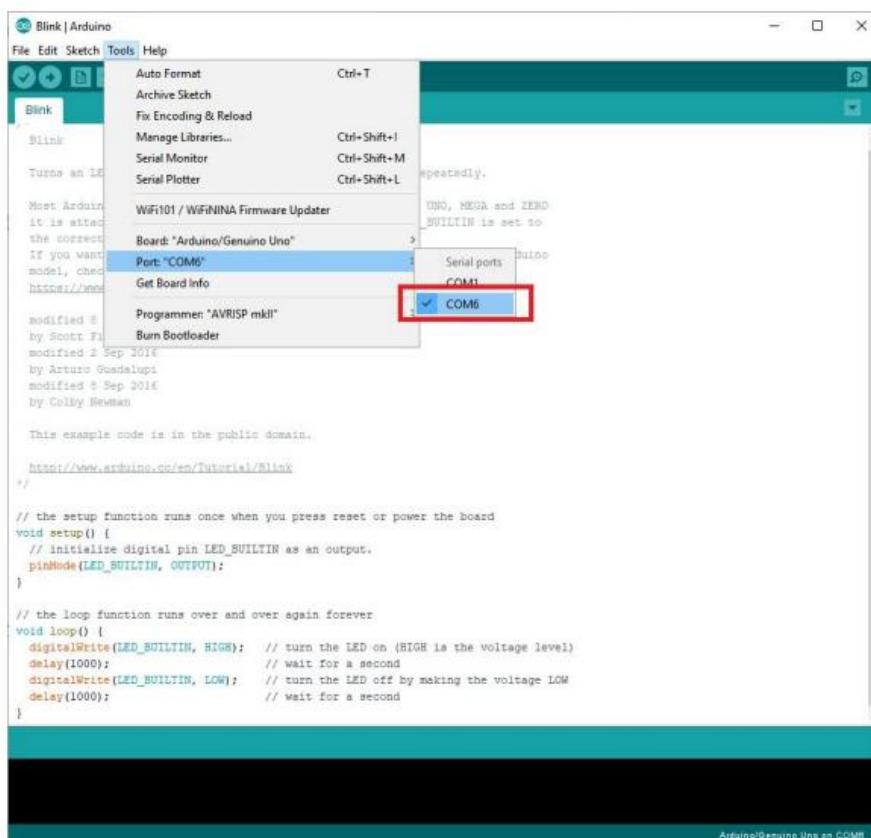

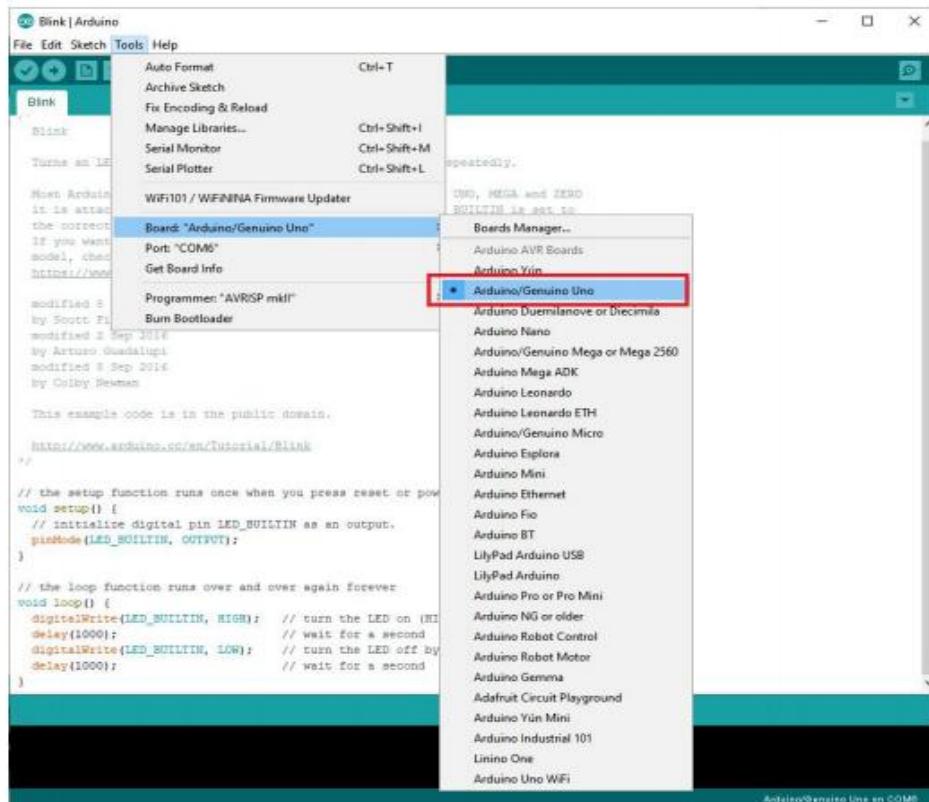

```
File Edit Sketch Tools Help
Blink
22
23
24 // the setup function runs once when you press reset or power the board
25 void setup() {
26   // initialize digital pin LED_BUILTIN as an output.
27   pinMode(LED_BUILTIN, OUTPUT);
28 }
29
30 // the loop function runs over and over again forever
31 void loop() {
32   digitalWrite(LED_BUILTIN, HIGH);    // turn the LED on (HIGH is the voltage level)
33   delay(1000);                      // wait for a second
34   digitalWrite(LED_BUILTIN, LOW);     // turn the LED off by making the voltage LOW
35   delay(1000);                      // wait for a second
36 }
```

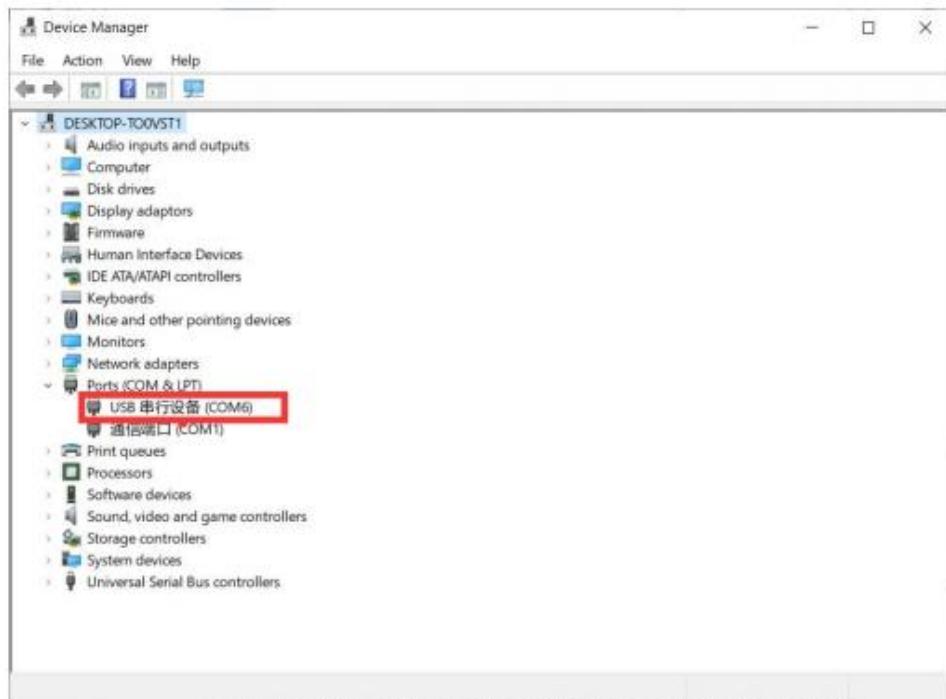

Arduino Uno on COM3

Attach your Arduino board to your computer with the USB cable and check that the 'Board Type' and 'Serial Port' are set correctly.

LROBRUYA

LROBRUYA

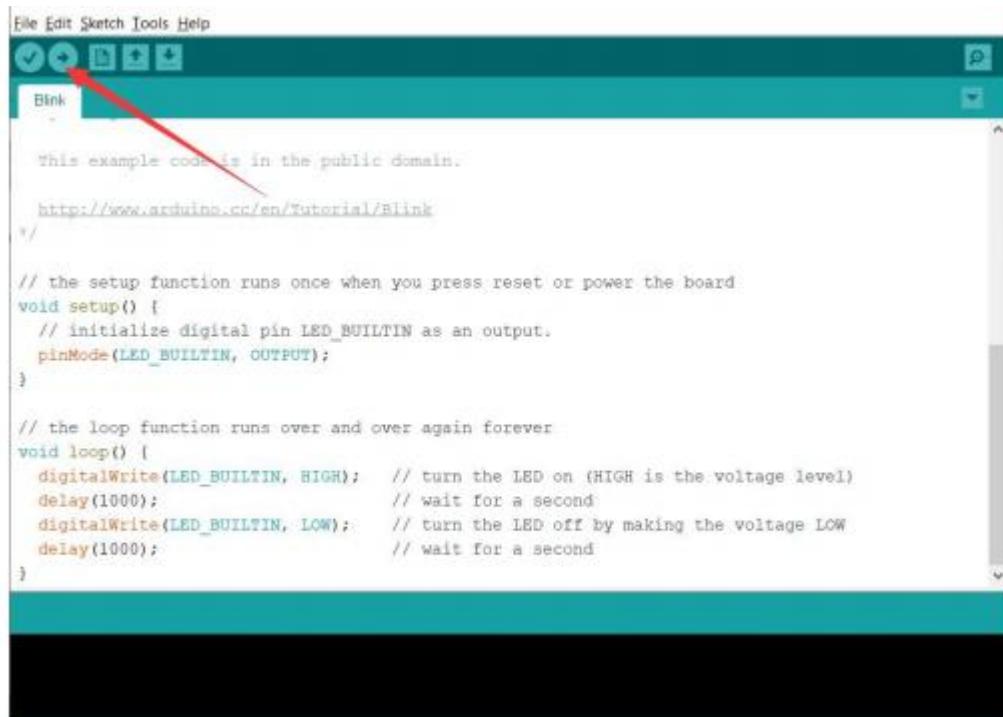

Note: The Board Type and Serial Port here are not necessarily the same as shown in picture. If you are using UNO, then you will have to choose Arduino UNO as the Board Type, other choices can be made in the same manner. And the Serial Port displayed for everyone is different, despite COM 6 chosen here, it could be COM3 or COM4 on your computer. A right COM port is supposed to be COMX (arduino XXX), which is by the certification criteria.

The Arduino IDE will show you the current settings for board at the bottom of the window.

LROBRUYA

Click on the 'Upload' button. The second button from the left on the toolbar.

When the status bar prompts "Done uploading", it means the code upload is successful

LROBRUYA

```
File Edit Sketch Tools Help
Blink
1 // the setup function runs once when you press res
2 void setup()
3 {
4 // initialize digital pin LED_BUILTIN as an output
5 pinMode(LED_BUILTIN, OUTPUT);
6 }
7 // the loop function runs over and over again forever
8 void loop()
9 {
```

Done compiling.

Build options changed, rebuilding all

Sketch uses 924 bytes (2%) of program storage space.

Global variables use 9 bytes (0%) of dynamic memory,

19 Arduino Uno on COM3

If an error message appears.

Problem uploading to board. See <http://www.arduino.cc/en/Guide/Troubleshooting#upload> for suggestions. [Copy error messages](#)

An error occurred while uploading the sketch

avrduude: ser_open(): can't open device "\\.\COM15": The system cannot find the file specified.

Problem uploading to board. See <http://www.arduino.cc/en/Guide/Troubleshooting#upload> for suggestions.

Arduino/Genuine Uno on COM15

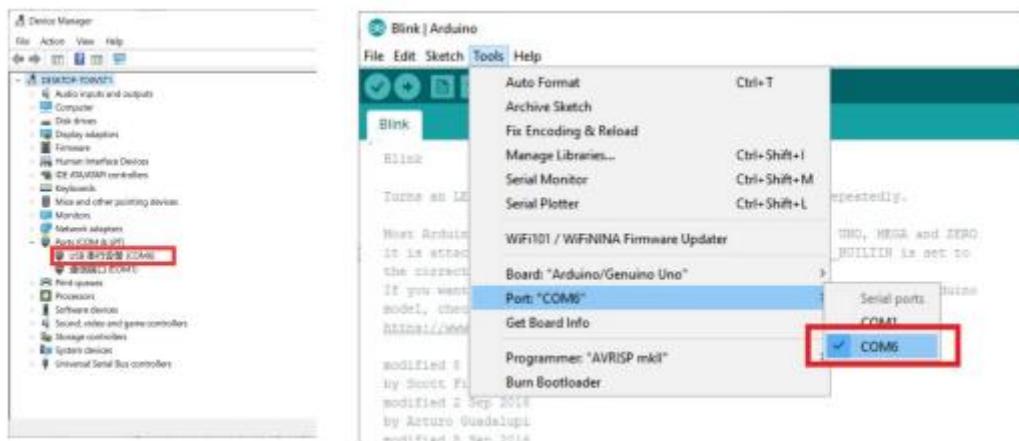

There can be several reasons:

1. The arduino uno driver software is not installed successfully, please

LROBRUYA

refer to the course for the installation steps: [How to Install Arduino Driver.](#)

2. The communication serial port selection of arduino uno is wrong; you can check the communication port COMx of your arduino uno in the computer in the device manager.

3. If your Arduino uno is connected to a Bluetooth module, it will occupy the communication serial port. You need to remove the Bluetooth module connection before uploading the code.

4. The USB data cable is not firmly connected. Check if there are any of the above problems. After correcting, follow the previous steps to re-operate.

Sample Program

```
// the setup function runs once when you press reset or power the board

void setup()

{

// initialize digital pin LED_BUILTIN as an output.

pinMode(LED_BUILTIN, OUTPUT);

}

// the loop function runs over and over again forever

void loop()

{

digitalWrite(LED_BUILTIN, HIGH);

// turn the LED on (HIGH is the voltage level)

delay(1000);

// wait for a second

digitalWrite(LED_BUILTIN, LOW);

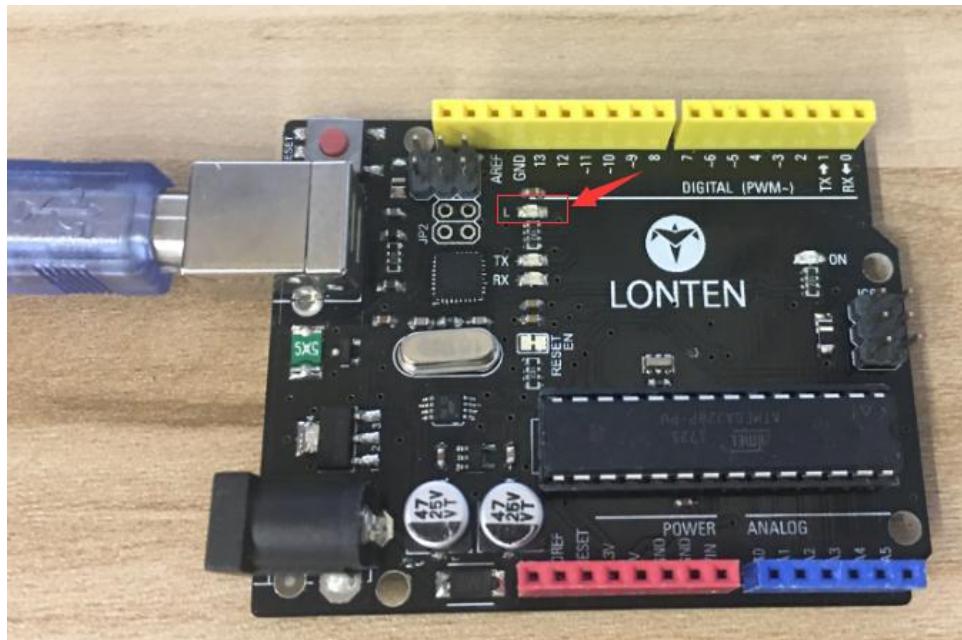

// turn the LED off by making the voltage LOW

delay(1000);

// wait for a second

}
```

LROBRYA

After the code is successfully uploaded, the "L" character LED will flash once per second. So far, you have completed the testing process of your first program.

Lesson 1 LED Flash

Overview

LED has wide applications. Most signal lights we saw in our daily life use LED as its major light source. In today's experiment, we are going to use Arduino to make LED module flashing.

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) LED module* 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

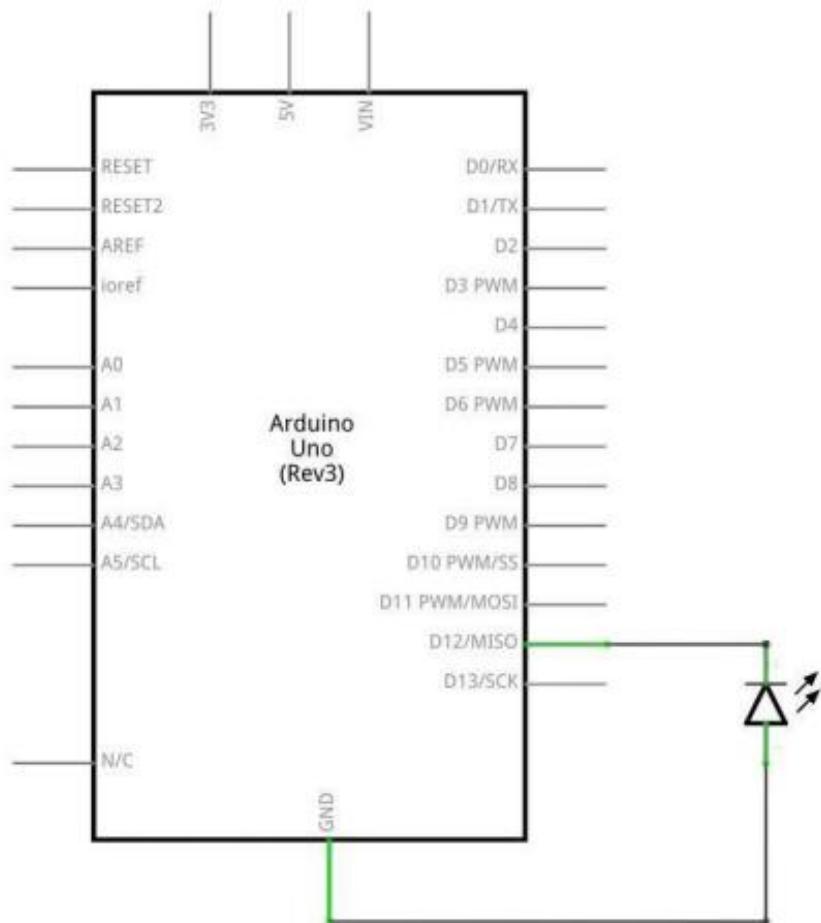

This is a special LED module. When you connect it to ARDUINO development board, after program, it can emit beautiful light. Of course, you can also control it using PWM. It will be like fireflies at night. Isn't cool?

We can also combine it with other sensors to do interesting interactive experiments.

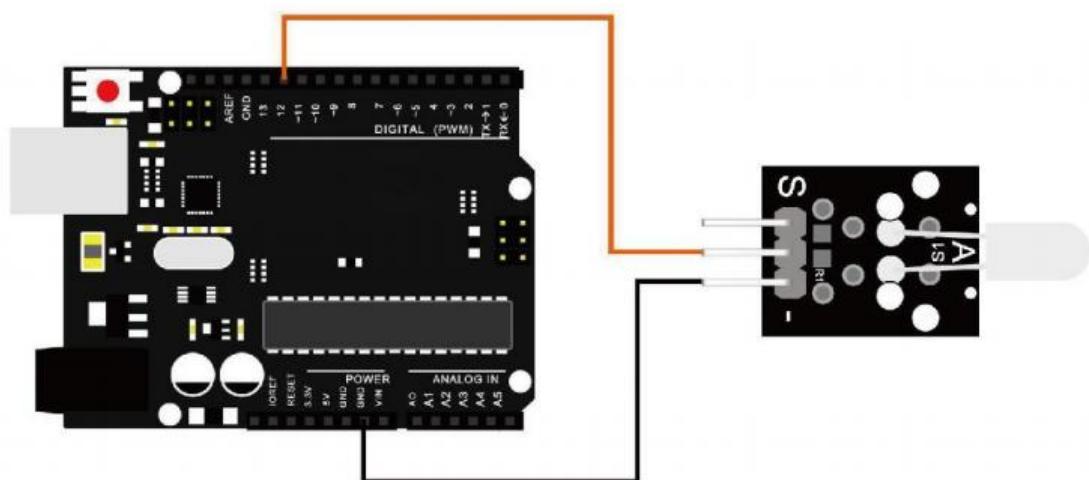

Connection

Schematic

LROBRUYA

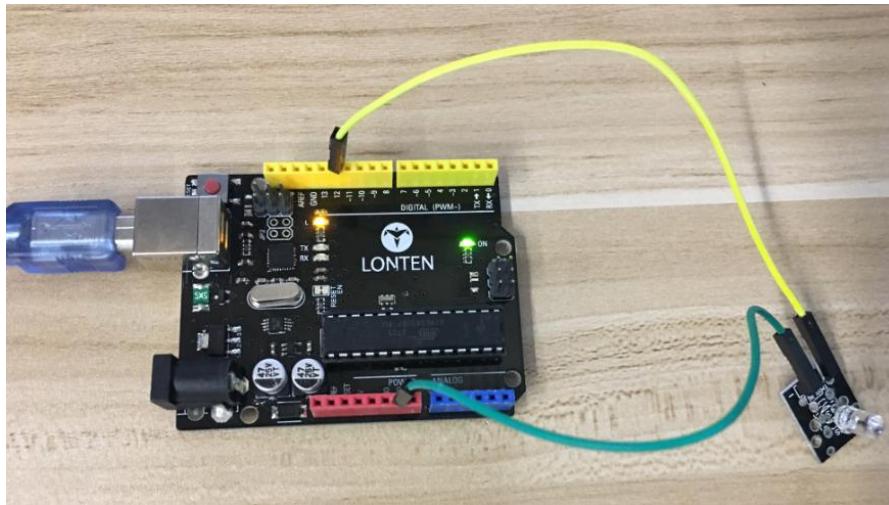

wiring diagram

LROBRYA

Example picture

Result

Done uploading the code, you can see the LED on the module flashing for one second then off for one second, repeatedly. If it is not, go back and check your operations.

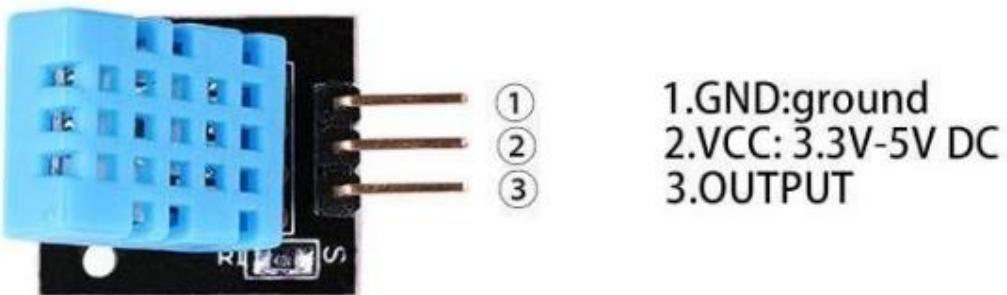

Lesson 2 Temp and Humidity module

Overview

In this tutorial we will learn how to use a DHT11 Temperature and Humidity Sensor. It has excellent quality, fast response, anti-interference ability and high cost performance advantages. Each DHT11 sensor features extremely accurate calibration data of humidity calibration chamber.

LROBRYA

Again we will be using a Library specifically designed for these sensors that will make our code short and easy to write.

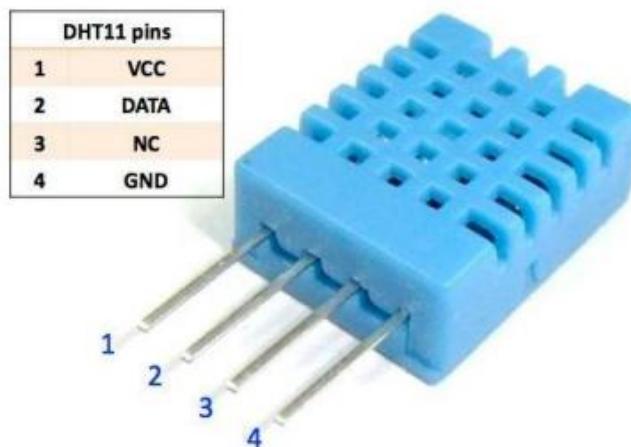

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Temperature and Humidity Unit *1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Temp and humidity sensor:

This DHT11 Temperature and Humidity Sensor features calibrated digital signal output with the temperature and humidity sensor complex. Its technology ensures high reliability and excellent long-term stability. A high-performance 8-bit micro controller is connected. This sensor includes a resistive element and a sense of wet NTC temperature measuring devices.

Applications: HVAC, dehumidifier, testing and inspection equipment, consumer goods, automotive, automatic control, data loggers, weather stations, home appliances, humidity regulator, medical and other humidity measurement and control.

Product parameters Relative

humidity: Resolution: 16Bit

Repeatability: $\pm 1\%$ RH

Accuracy: At 25°C $\pm 5\%$ RH

Interchangeability: fully interchangeable

Response time: $1/e(63\%)$ of 25°C 6s

1m / s air 6s

Hysteresis: $<\pm 0.3\%$ RH

Long-term stability: $<\pm 0.5\%$ RH / yr in

Temperature:

LROBRYA

Resolution: 16Bit

Repeatability: $\pm 0.2^\circ\text{C}$

Range: At 25°C $\pm 2^\circ\text{C}$

Response time: 1 / e (63%) 10S

Electrical Characteristics

Power supply: DC $3.5\sim 5.5\text{V}$

Supply Current: measurement 0.3mA standby $60\mu\text{A}$

Sampling period: more than 2 seconds

Pin Description:

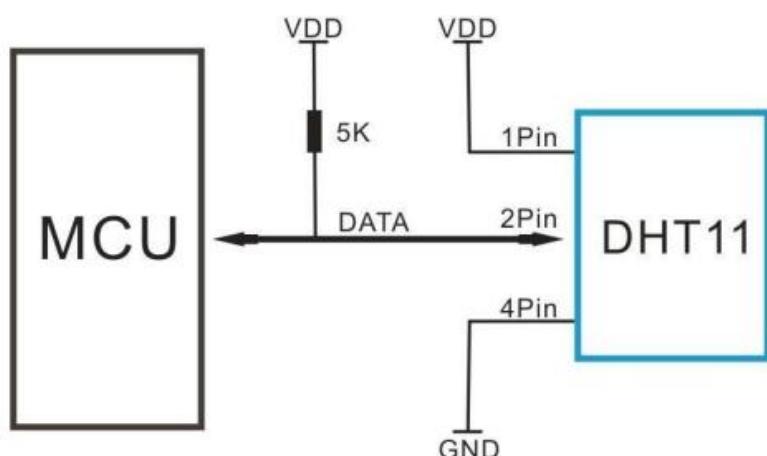

1, the VDD power supply $3.5\sim 5.5\text{V}$ DC

2 DATA serial data, a single bus

3, NC, empty pin

4, GND ground, the negative power

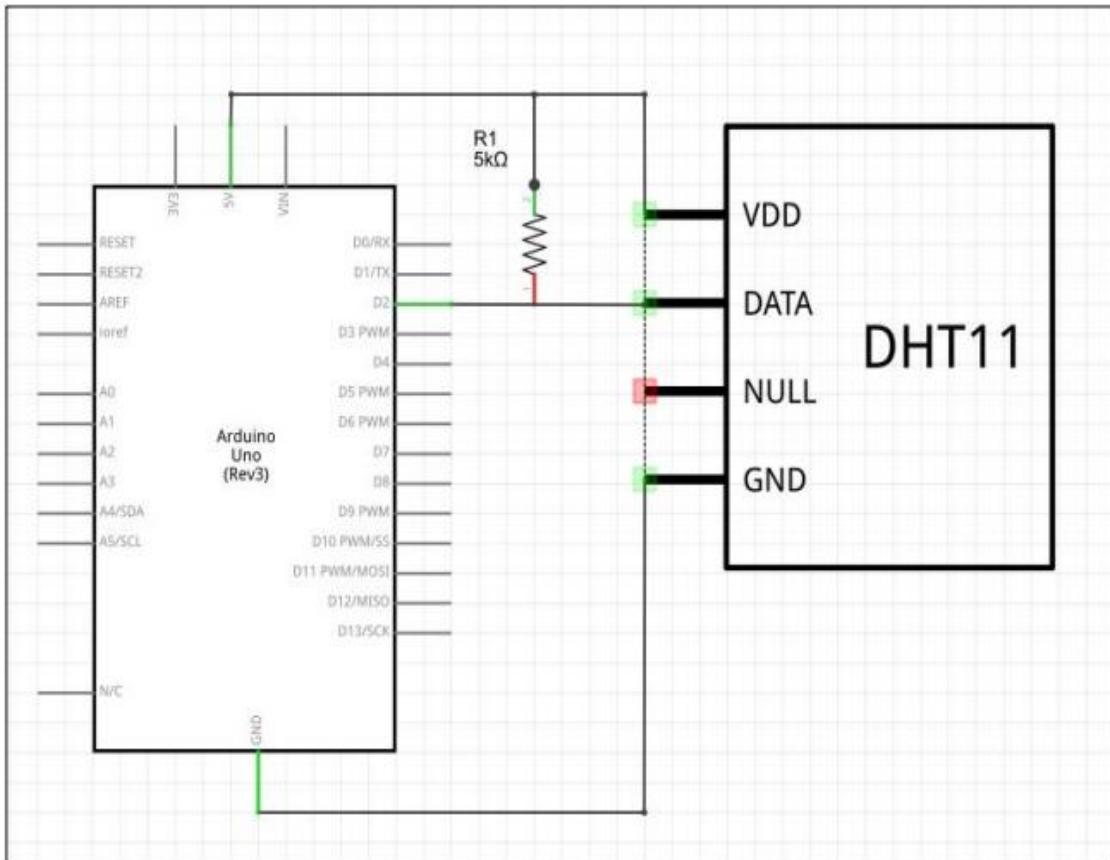

Typical Application

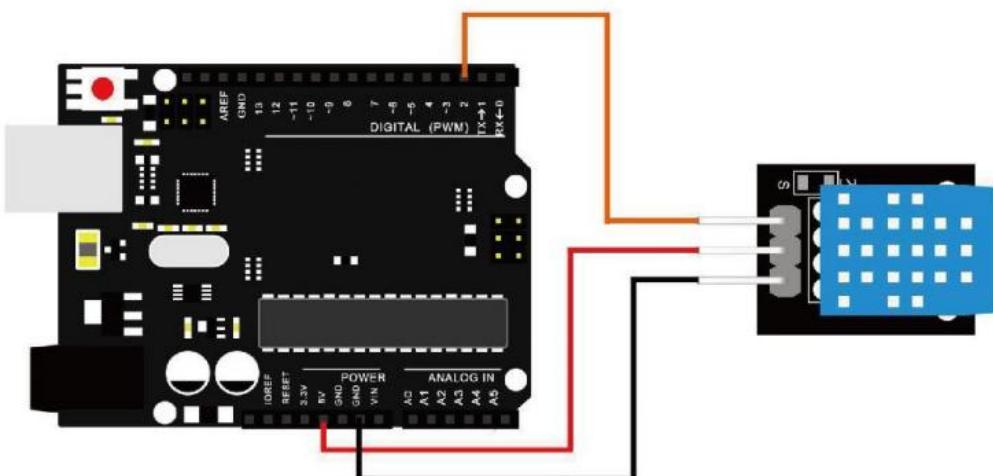

LROBRUYA

Connection

Schematic

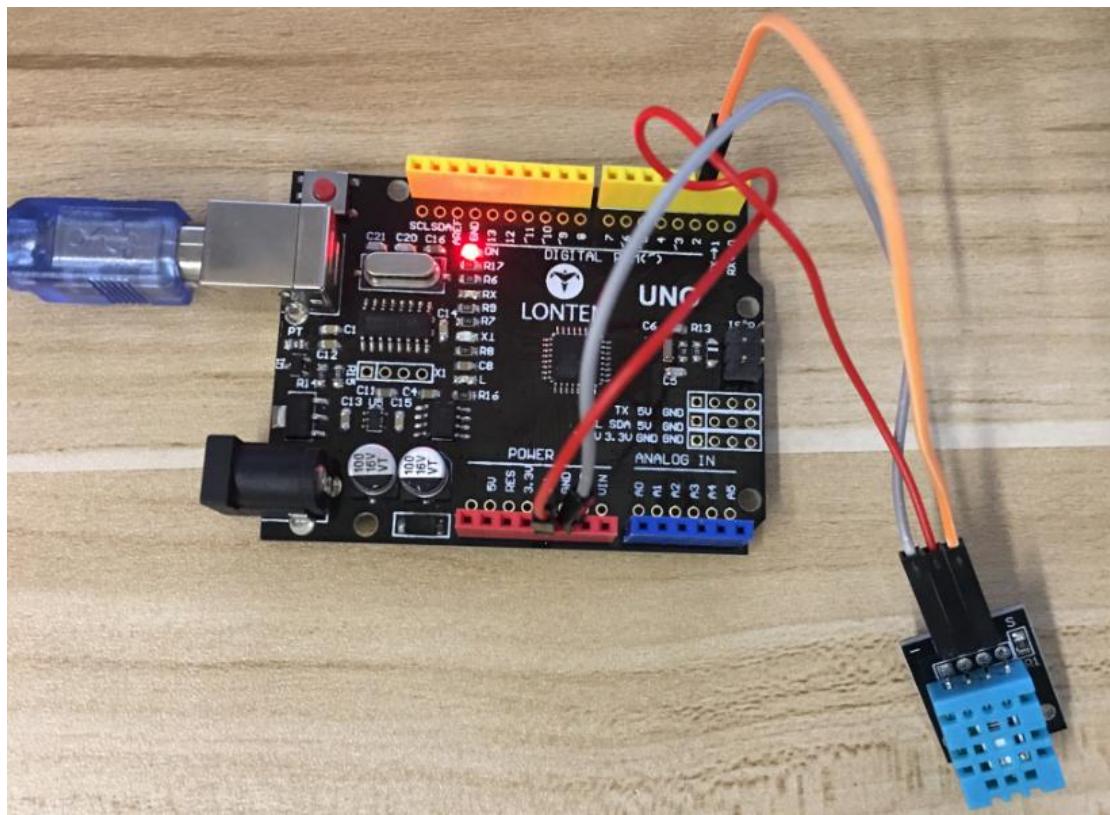

wiring diagram

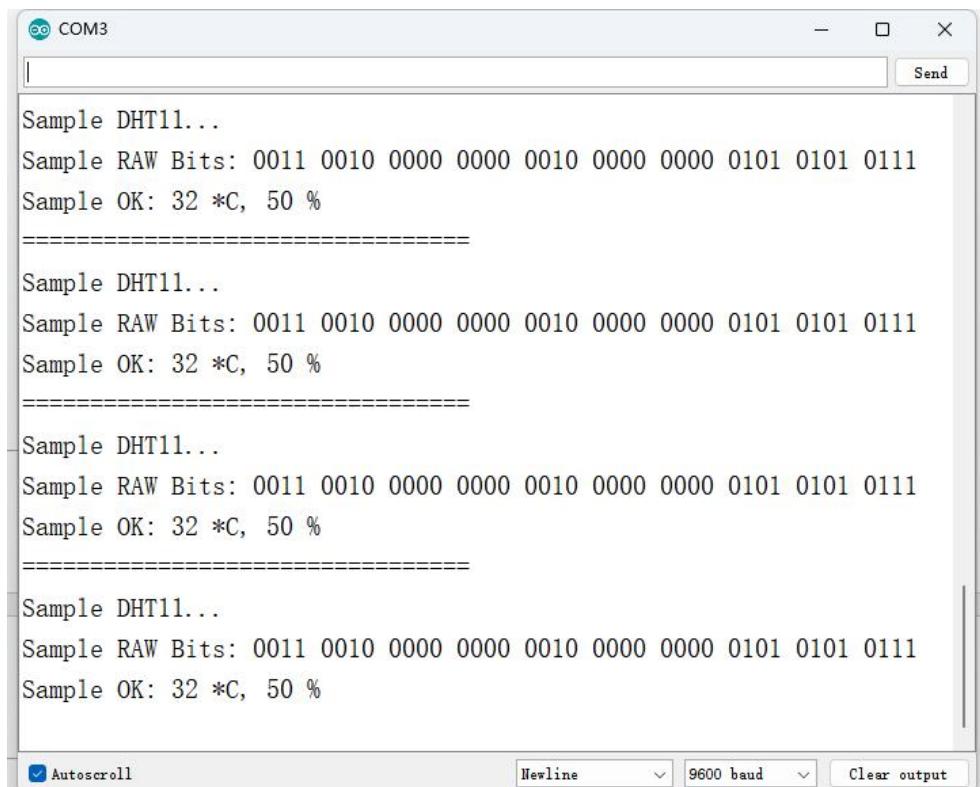

LROBRYA

Example picture

Result

Upload the program then open the monitor, we can see the data as below:(It shows the temperature of the environment, we can see it is 32 degree).

A screenshot of a Windows-style serial monitor window titled "COM3". The window shows a series of data samples from a DHT11 sensor. Each sample consists of a header "Sample DHT11...", followed by "Sample RAW Bits" in binary format (e.g., 0011 0010 0000 0000 0010 0000 0000 0101 0101 0111), and then "Sample OK: 32 *C, 50 %". The window has a "Send" button at the top right and a "Clear output" button at the bottom right. The bottom bar also includes "Autoscroll", "Newline", "9600 baud", and "Clear output" buttons.

Lesson 3 DS18B20 Digital Temperature Sensor Module

Overview

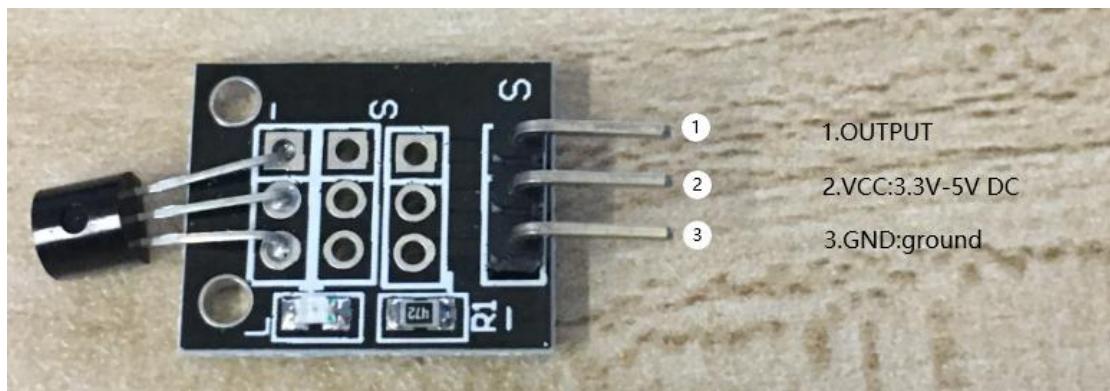

In this experiment, we will learn how to use DS18B20 module test the environmental temperature and make a thermometer.

Since the previous temperature sensor output is analog. So we need to add additional A/D and D/A chip into the line transformation. More -over, the Arduino external port is not rich resources and the utilization rate is not high. These cause a big challenge. So we are create the Ds18b20 module.

LROBRUYA

The new DS18B20 Temperature Sensor Module is very good solve the problem. It have the characteristic of the economy, unique1 wide band it can fully apply the Arduino platform.

Users can easily form a sensor network through using this module.

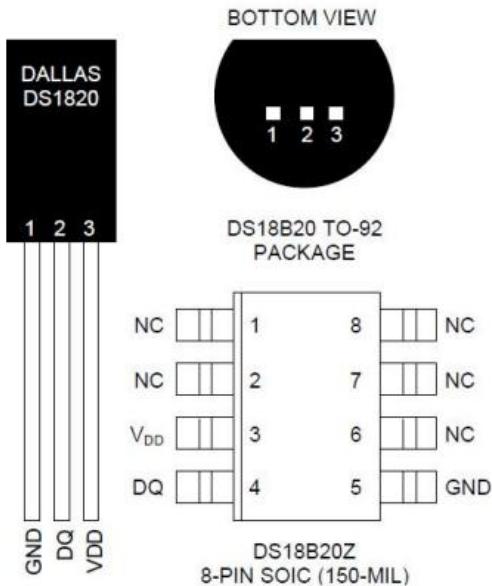

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) DS18B20 Module* 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

DS18B20:

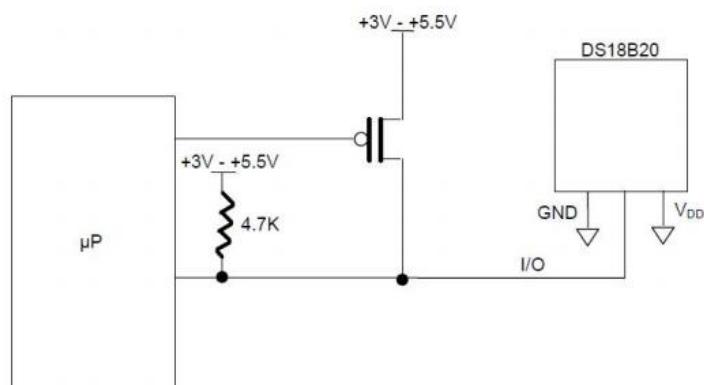

LROBRUYA

PIN ASSIGNMENT

PIN DESCRIPTION

- GND - Ground
DQ - Data In/Out
V_{DD} - Power Supply Voltage
NC - No Connect

Principle

DS18B20 module is using a single bus. The power supply voltage range of 3.0 V to 5.5 V and no standby power supply. It can Measure

LROBRYA

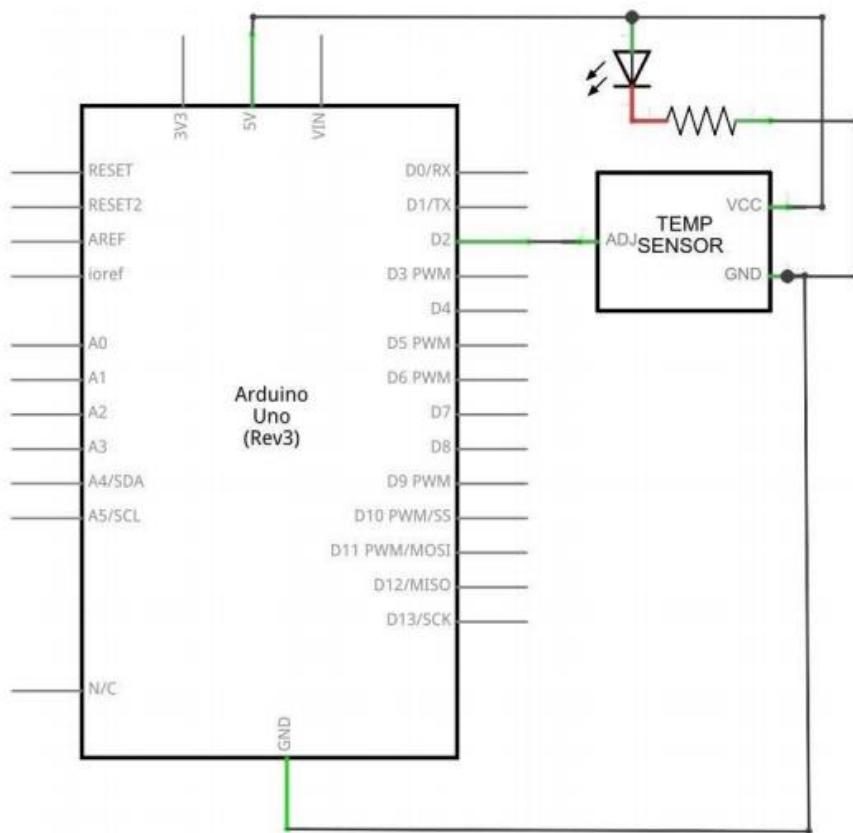

temperature range for -55 degree to +125 degree with accuracy of $\pm 0.5^\circ\text{C}$.

The programmable DPI of temperature sensor is from 9 to 12. temperature conversion is 12 digits lattice type. maximum is 750 milliseconds. Families can be defined non-volatile temperature alarm Settings.

Each DS18B20 contains a unique serial number so that multiple ds18b20 scan exist in a bus.

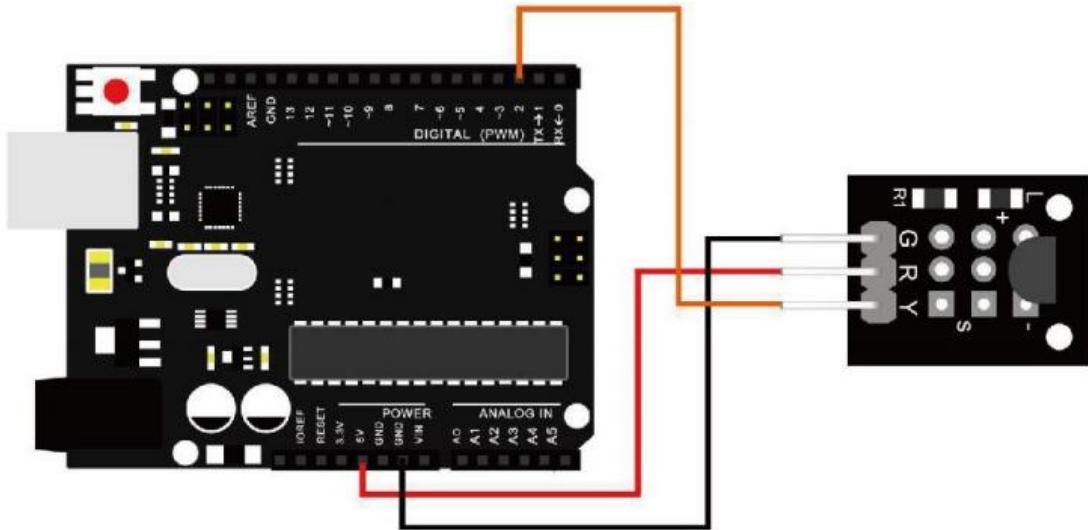

Connection

Schematic

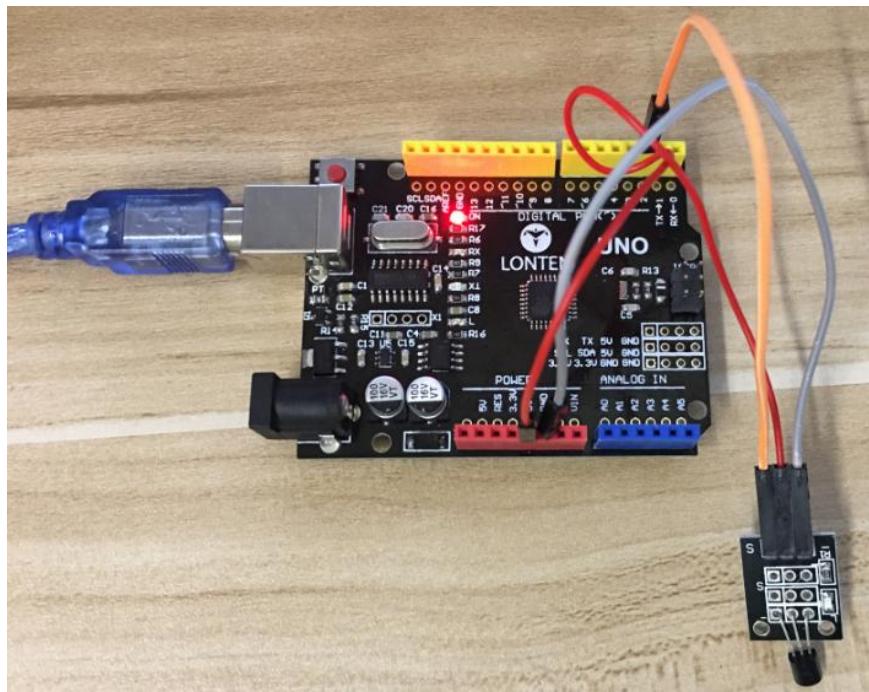

LROBRYA

wiring diagram

Example picture

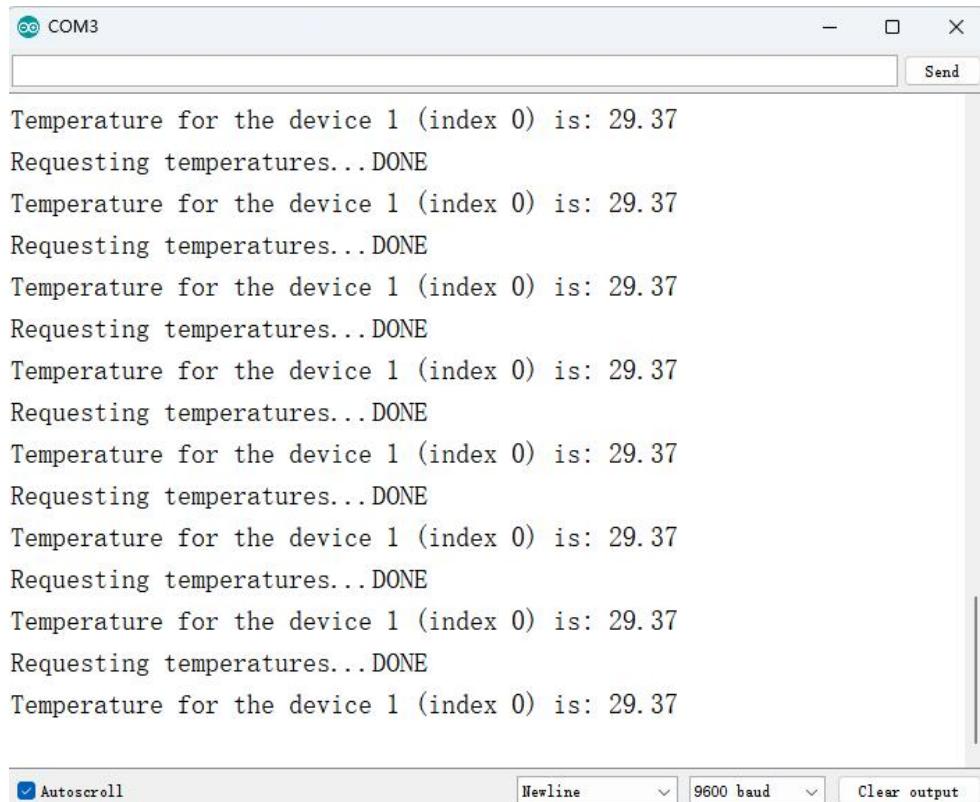

Result

Temperature sensor can detect temperature in numbers of different places at the same time.

LROBROUYA

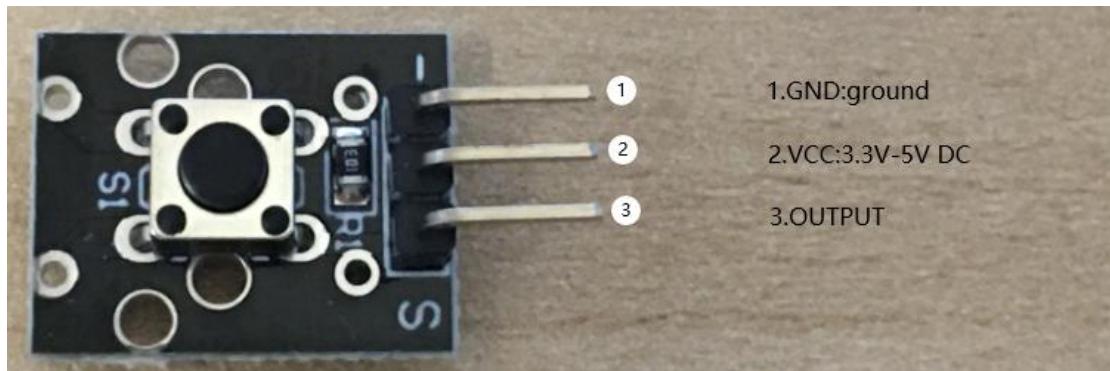

Upload the program then open the monitor, we can see the data as below:

Lesson 4 Button Switch Module

Overview

In this experiment, we will learn how to use button switch.

LROBROUYA

Component Required:

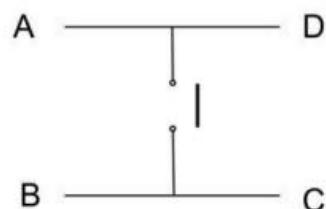

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Button Module* 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

PUSH SWITCHES:

Switches are simple components. When you press a button or flip a lever, they connect two contacts together so that electricity can flow through them.

The little tactile switches that are used in this lesson have four connections, which can be a little confusing.

There are only really two electrical connections, as inside the switch package pins B and C are connected together, as are A and D.

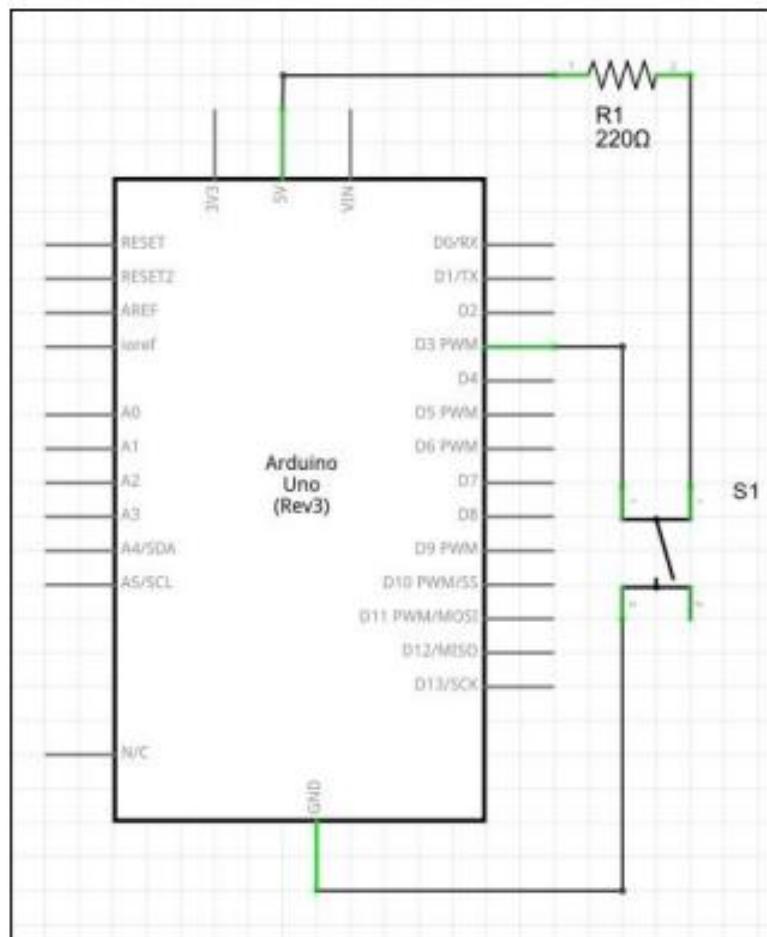

LROBROUYA

Principle

BUTTON SWITCH and number 13 port have the built-in LED simple circuit. To produce a switch flasher, we can use connect the digital port 13 to the built-in LED and connect the BUTTON SWITCHS port to number 3 port of LONTEN Uno board. When the switch sensing, LED twinkle light to the switch signal.

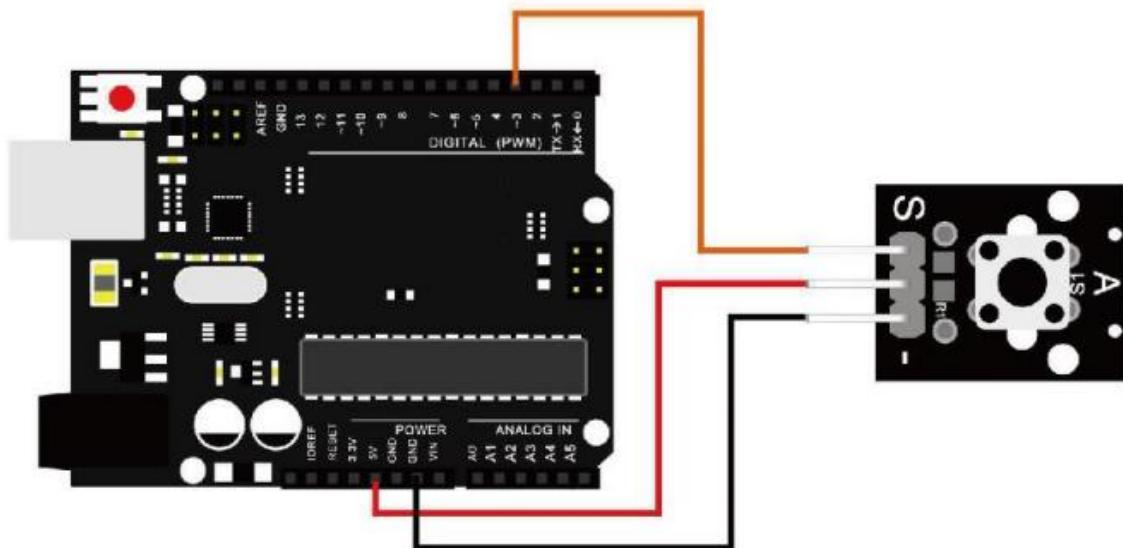

Connection

Schematic

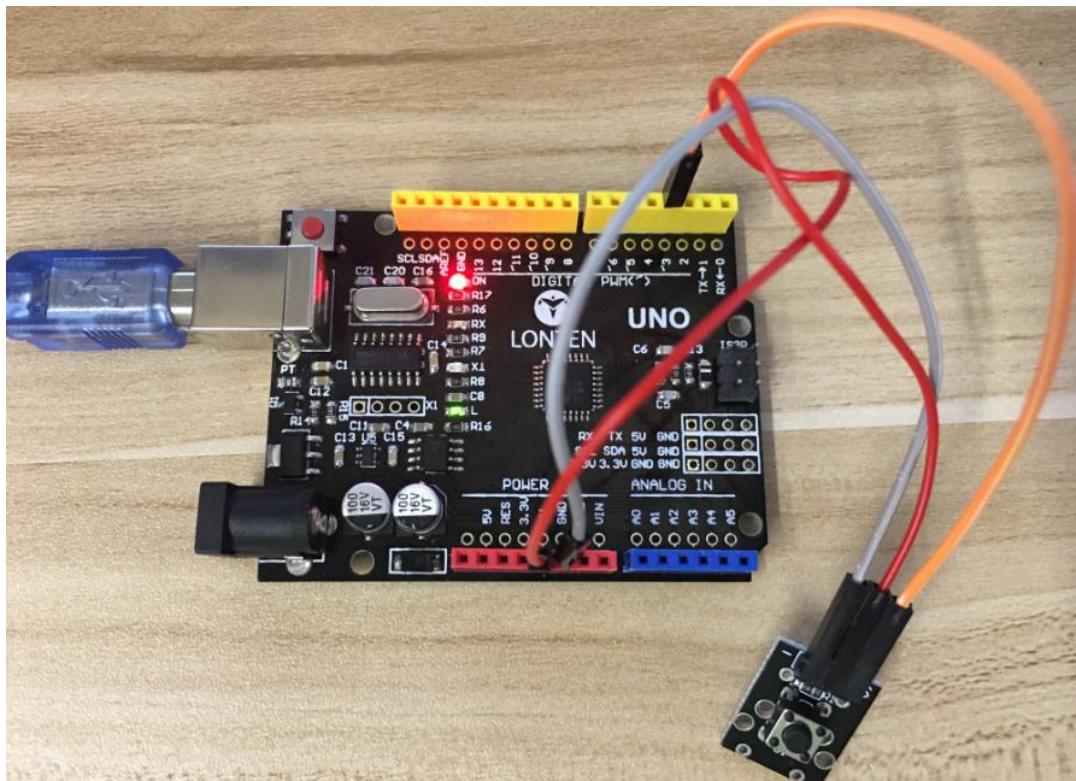

LROBRYA

wiring diagram

Example picture

LROBRYA

Result

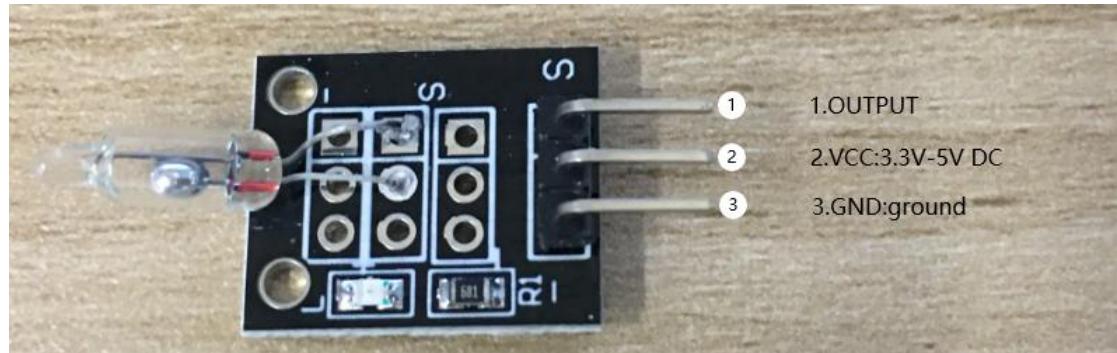

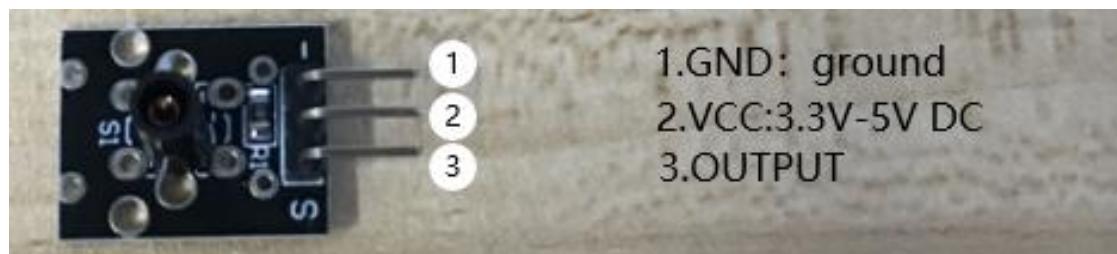

Connect the circuit as above and upload the program. Then push the button, you can see led on and off.

Lesson 5 Four Type of Switch Module

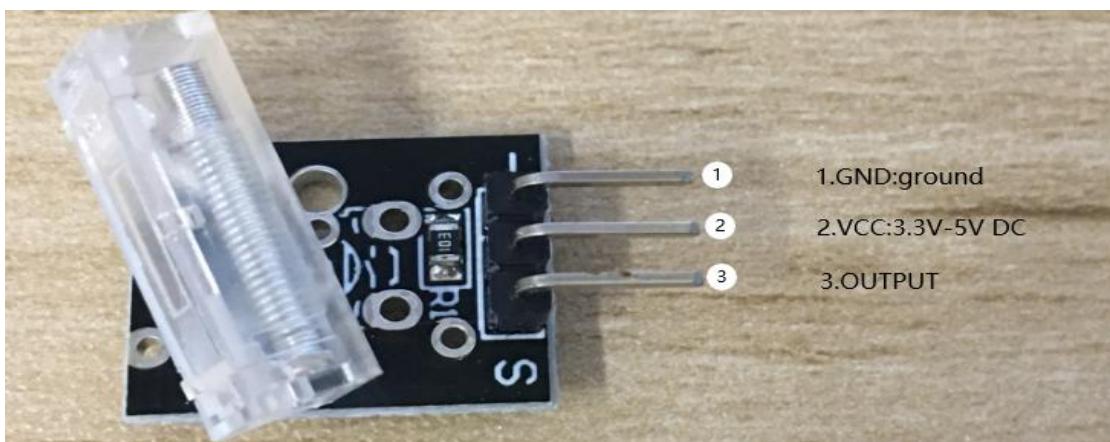

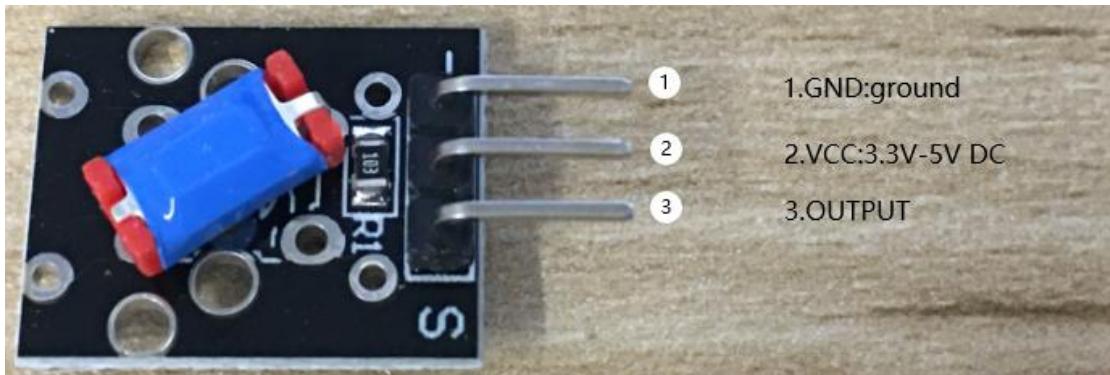

Overview

In this experiment, we will learn how to use switch modules.

Including shock switch module, mercury switch module, tilt switch module and knock switch module.

LROBRYA

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Shock switch module* 1
- (4) Mercury switch module* 1
- (5) tilt switch module* 1
- (6) Knock switch module* 1
- (7) Breadboard* 1
- (8) Breadboard Jumper Wires* Several

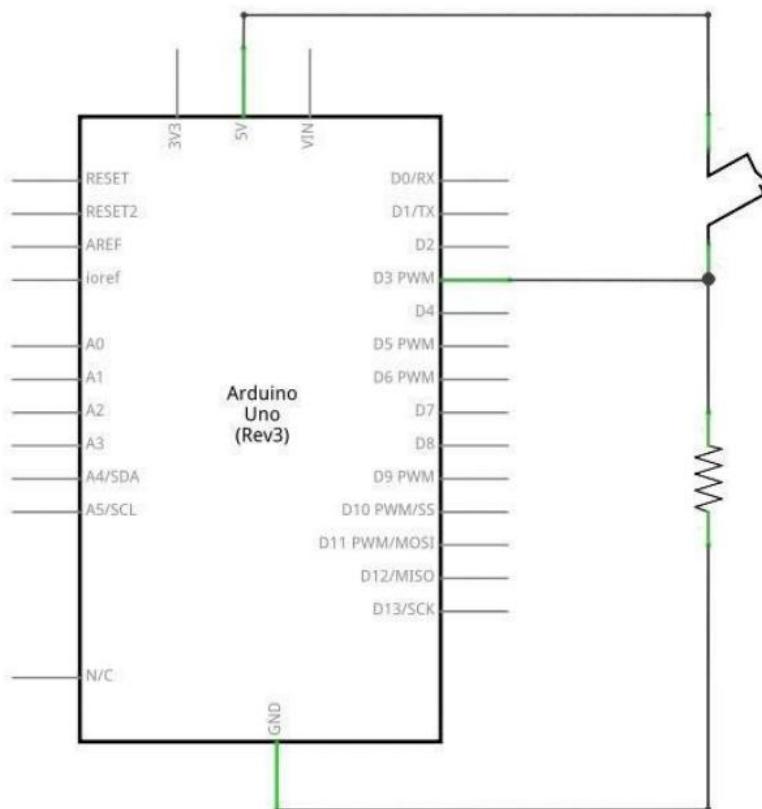

LROBRUYA

Principle

switch and number 13 port have the built-in LED simple circuit. To produce a SWITCH flasher, we can use connect the digital port 13 to the built-in LED and connect the SWITCH S port to number 3 port of LONTEN Uno board. When the SWITCH sensing, LED twinkle light to the SWITCH signal.

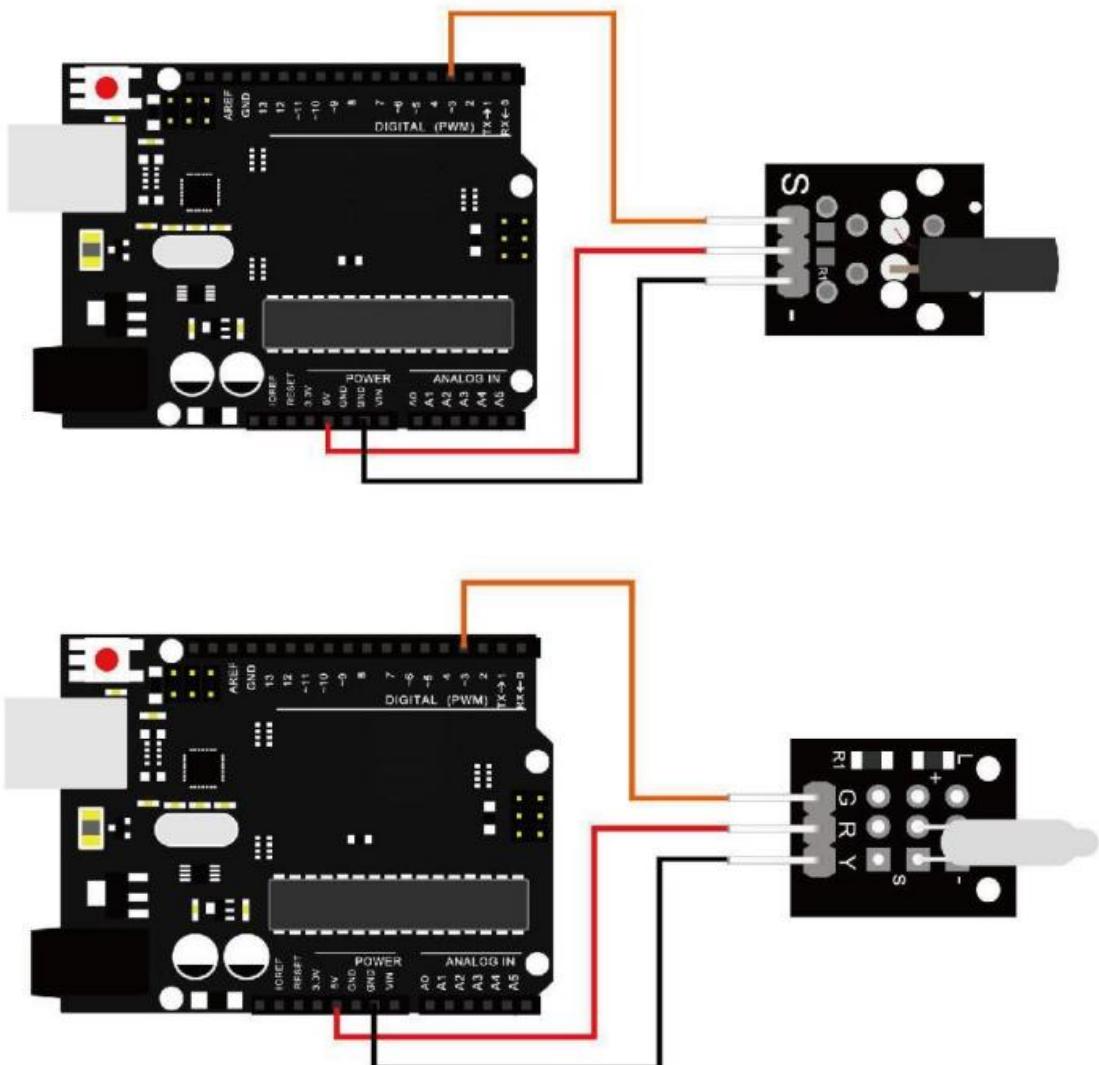

Connection

Schematic

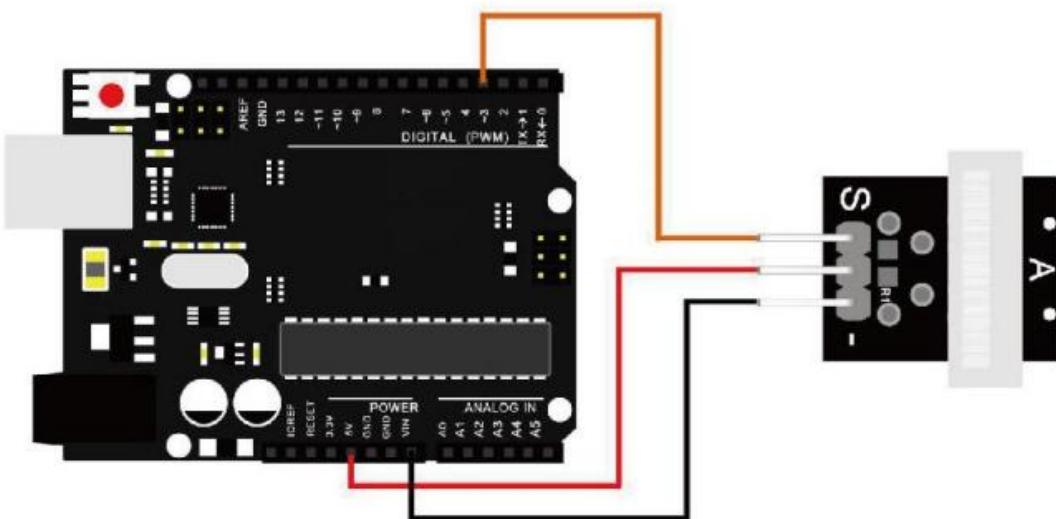

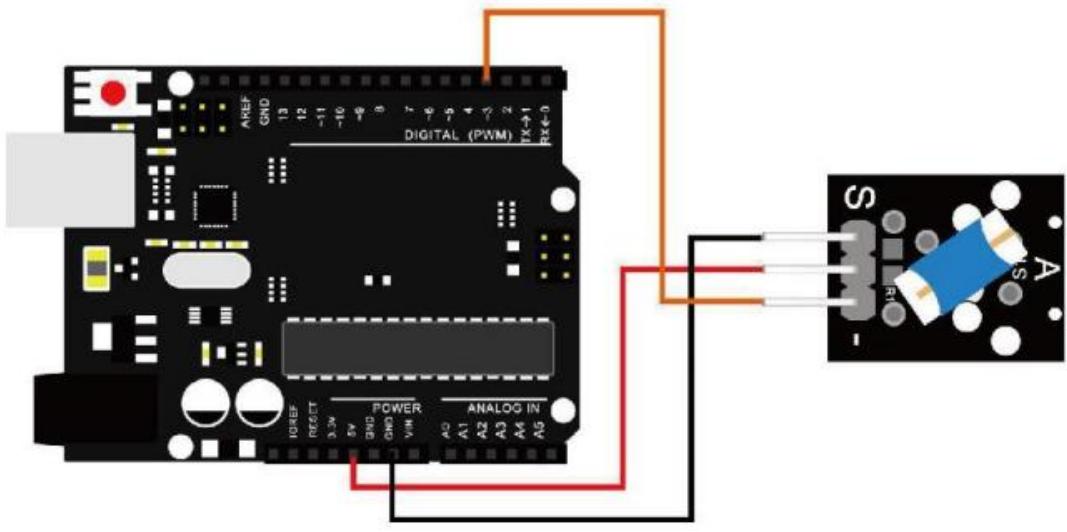

LROBRUYA

wiring diagram

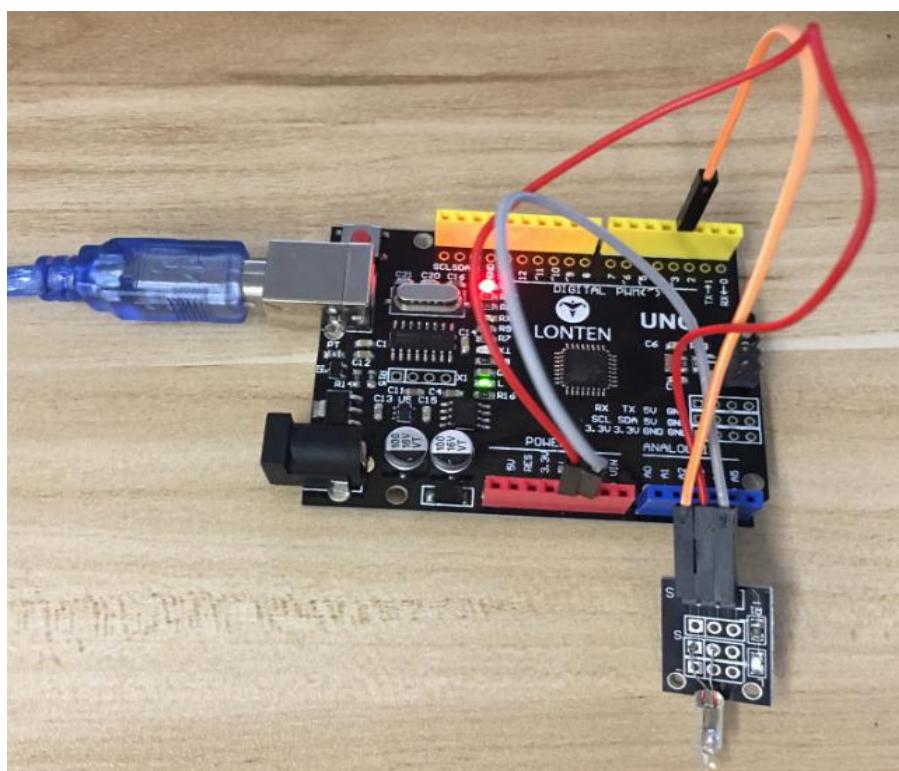

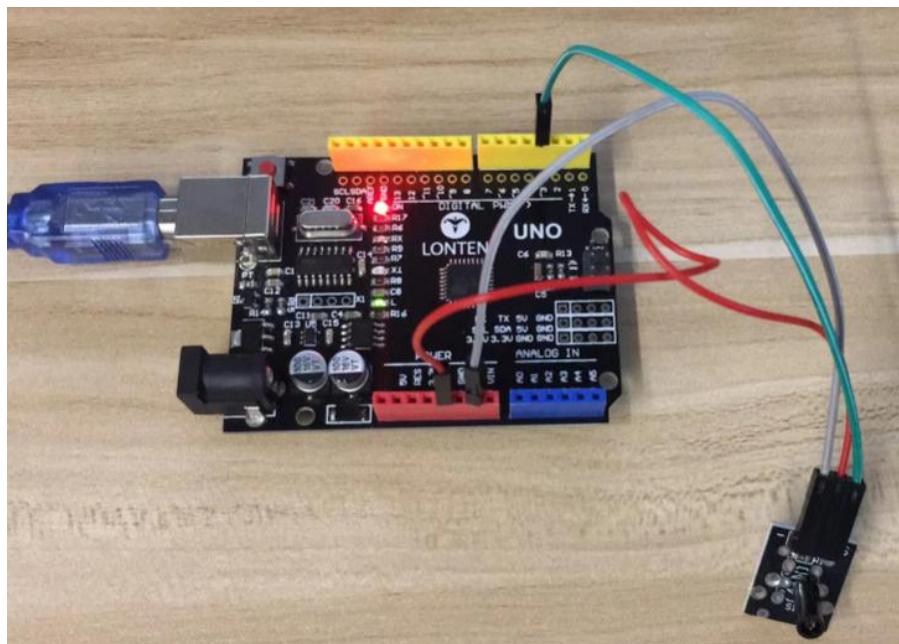

LROBRUYA

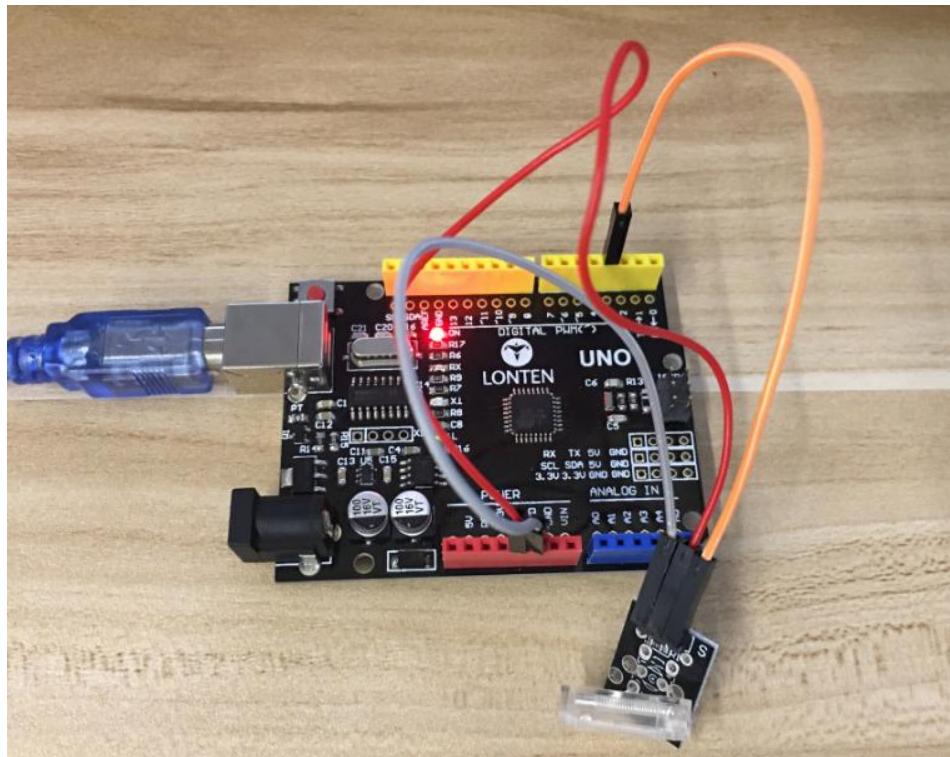

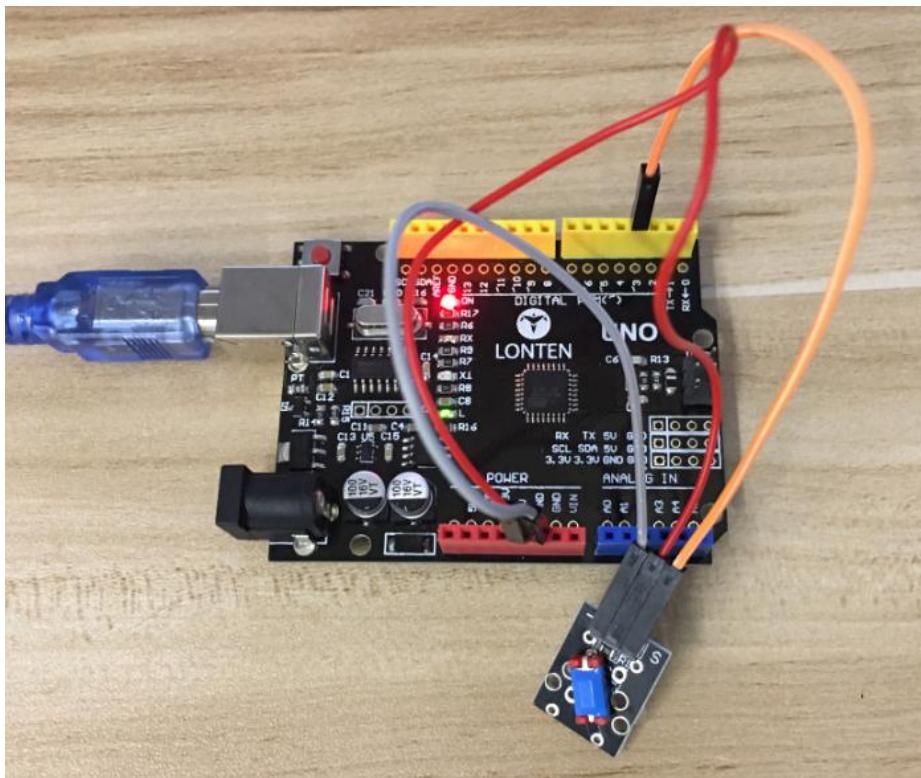

LROBRYA

Example picture

LROBRUYA

LROBRYA

Result

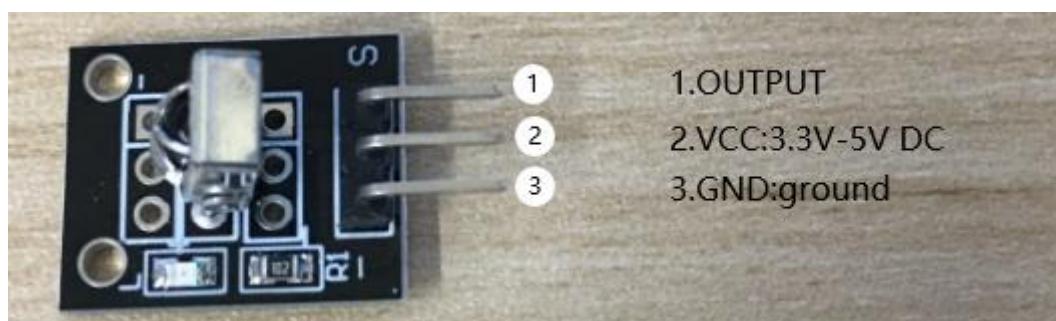

Connect the circuit as above and upload the program. Then lean or shock the sensor, you can see led on and off.

Lesson 6 IR Receiver and Emission

Overview

In this experiment, we will learn how to use Infrared Receiver and IR Emission module.

In fact now in our daily life they play an important role, a lot of household electrical appliances are used to this kind of device, such as air conditioning, TV, DVD, etc. Actually it is based on its wireless remote sensing and it is very convenient by using them.

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) IR Receiver module* 1
- (4) IR Emission module* 1
- (5) Breadboard* 1
- (6) Breadboard Jumper Wires* Several

Component Introduction

IR RECEIVER SENSOR:

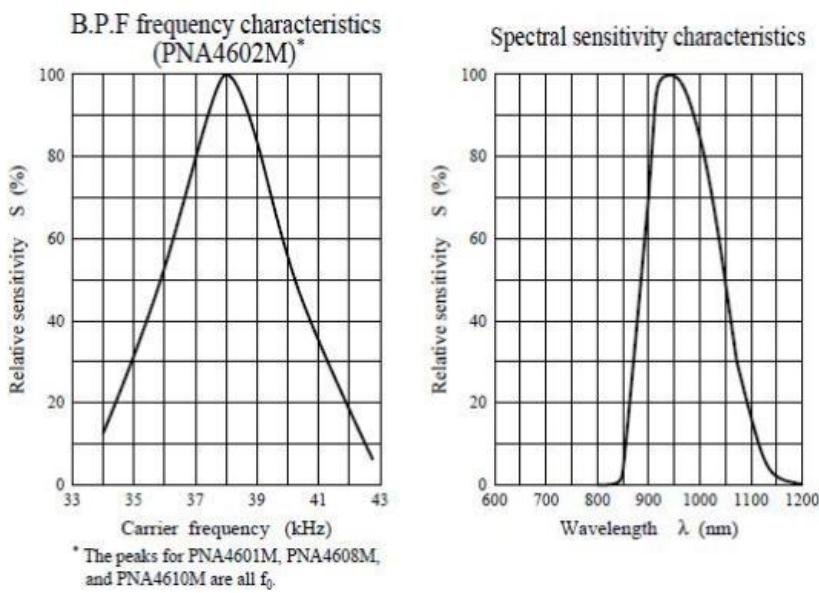

IR detectors are little microchips with a photocell that are tuned to listen to infrared light. They are almost always used for remote control detection every TV and DVD player has one of these in the front to listen for the IR signal from the clicker. Inside the remote control is a matching IR LED, which emits IR pulses to tell the TV to turn on, off or change channels. IR light is not visible to the human eye, which means it takes a little more work to test a setup.

There are a few difference between these and say a CdS Photocells:

IR detectors are specially filtered for Infrared light, they are not good at detecting visible light. On the other hand, photocells are good at detecting yellow/green visible light, not good at IR light.

- IR detectors have a demodulator inside that looks for modulated IR at 38 KHz. Just shining an IR LED won't be detected, it has to be PWM blinking at 38KHz. Photocells do not have any sort of demodulator and can detect any frequency (including DC) within the response speed of the photocell (which is about 1KHz) .
- IR detectors are digital out - either they detect 38KHz IR signal and output low (0V) or they do not detect any and output high (5V). Photocells act like resistors, the resistance changes depending on how much light they are exposed to.

What You Can Measure

As you can see from these datasheet graphs, the peak frequency detection is at 38 KHz and the peakLED color is 940 nm. You can use from about 35KHz to 41KHz but the sensitivity will drop off so that it wont detect as

LROBRYA

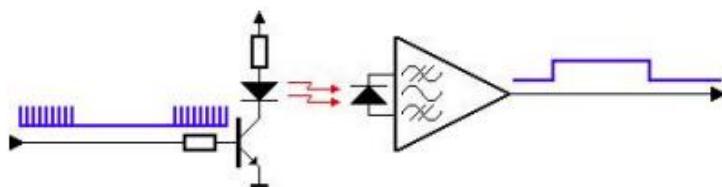

well from afar. Likewise, you can use 850 to 1100 nm LEDs but they won't work as well as 900 to 1000 nm so make sure to get matching LEDs! Check the datasheet for your IR LED to verify the wavelength.

Try to get a 940nm - remember that 940 nm is not visible light (its Infra Red)!

Principle

Firstly, let's know the structure of the infrared receiving head: there are two important elements inside the infrared receiving head, IC and PD. IC is receiving head processing components, mainly composed of silicon and circuit. It is a highly integrated device. The main function is filter, plastic, decoding, amplification, etc. PD is a photosensitive diode. The main function is to receive the light signal.

Below is a brief working principle diagram:

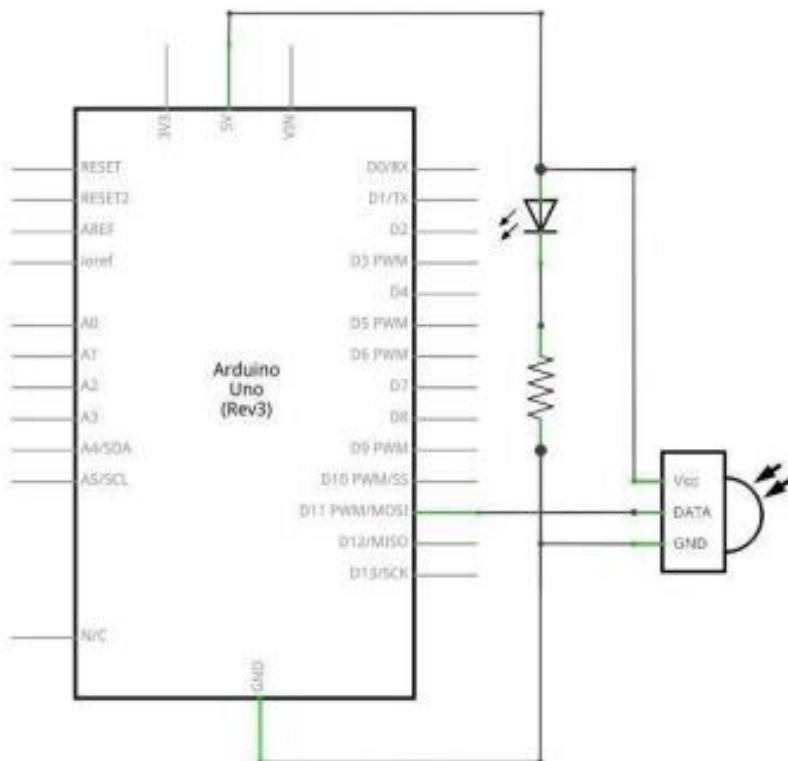

Infrared emitting diode launch out the modulation signal and infrared receiver head will receive, decode, filter and soon to regain the signal.

LROBROUYA

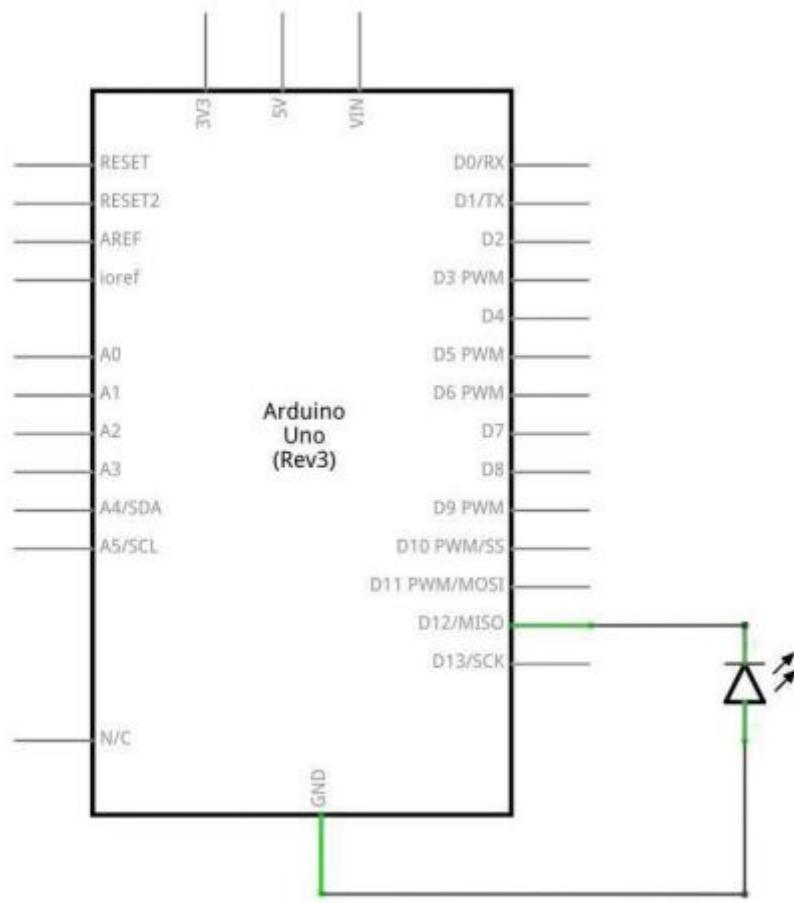

Infrared emitting diode: keep clean and in good condition. All the parameters in the process of working shall not exceed the limit value (positive To the current 30~60mA, positive pulse current 0.3~1A, reverse voltage 5V, dissipation power 90mW, working temperature range -25~+80 °C , and storage temperature range between 40~100 °C , the welding temperature 260 °C) infrared to be with a closed head should be matching use, otherwise it will influence the sensitivity.

Connection

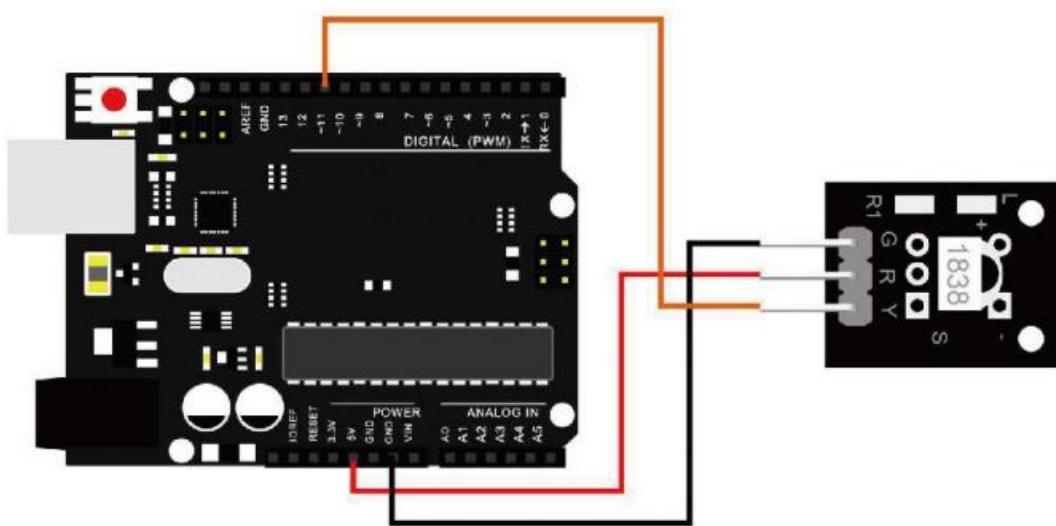

Schematic

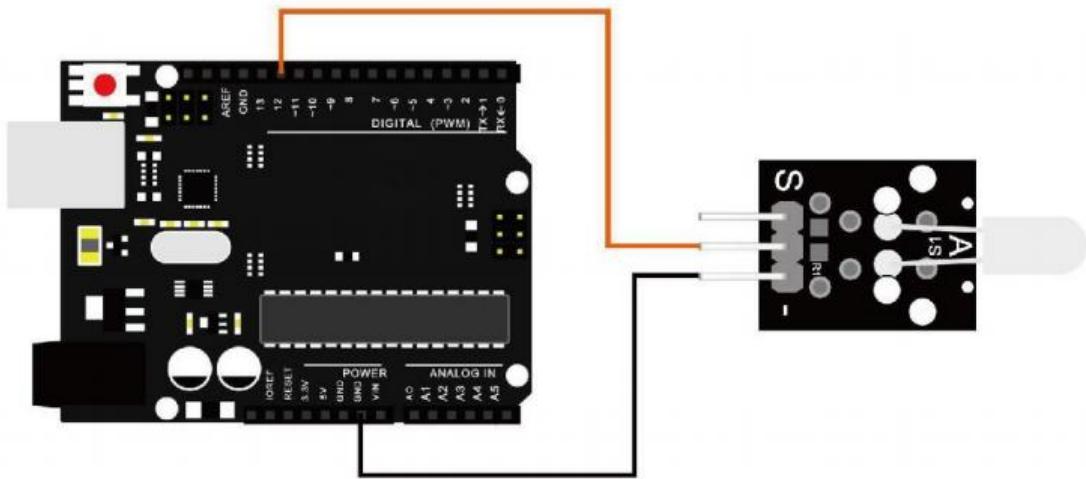

LROBROUYA

Lesson 7 Active and Passive Buzzer

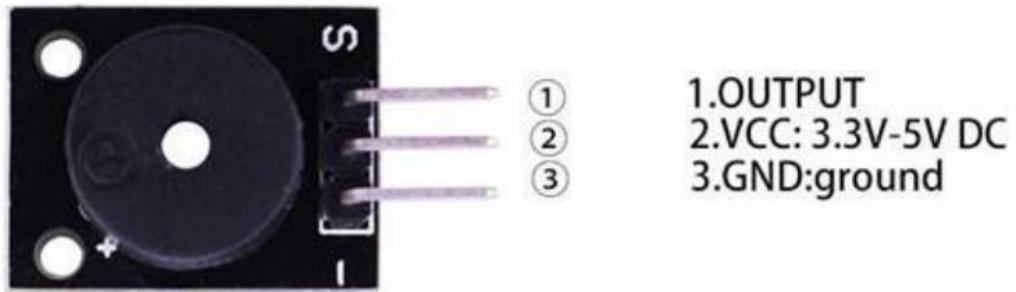

Overview

In this experiment, we will learn how to use buzzer module.

With the Arduino we can complete a lot of interactive work, commonly what we used is the light shows. And we has been use the LED small lights in the experiment before. In this experiment we will make the circuit having noise. The common components that can make sound are buzzer and speakers. Compared to the speaker, buzzer is more simple and easy to use so in this experiment we adopts the buzzer.

1.OUTPUT
2.VCC: 3.3V-5V DC
3.GND:ground

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Active buzzer module* 1
- (4) Passive buzzer module* 1
- (5) Breadboard* 1
- (6) Breadboard Jumper Wires* Several

Component Introduction

Active Buzzer:

As a type of electronic buzzer with integrated structure, buzzers, which are supplied by DC power, are widely used in computers, printers, photocopiers, alarms, electronic toys, automotive electronic devices, telephones, timers and other electronic products for voice devices.

Buzzers can be categorized as active and passive ones (see the following picture). Turn the pins of two buzzers face up, and the one with a green

circuit board is a passive buzzer, while the other enclosed with a black tape is an active one.

The difference between an active buzzer and a passive buzzer is:

An active buzzer has a built-in oscillating source, so it will make sounds when electrified. But a passive buzzer does not have such source, so it will not tweet if DC signals are used; instead, you need to use square waves whose frequency is between 2K and 5K to drive it. The active buzzer is often more expensive than the passive one because of multiple built-in oscillating circuits.

Passive Buzzer:

Passive buzzer, in fact, just use PWM generating audio, drives the buzzer, allowing the air to vibrate, can sound. Appropriately changed as long as the vibration frequency, it can generate different sound scale. For example, sending a pulse wave can be generated 523Hz Alto Do, pulse 587Hz can produce mid range Re, 659Hz can produce mid range Mi. If you then with a different beat, you can play a song. Here be careful not to use the Arduino analog Write () function to generate a pulse wave, because the frequency analog Write () is fixed (500Hz), no way to scale the output of different sounds.

Distinguish between Active and Passive Buzzer

Teach you to distinguish between active and passive buzzer

Now a small buzzer on the market because of its small size (diameter of only 11 mm), light weight, low price, solid structure, and is widely used in a variety of needs audible electrical equipment, electronic production and microcontroller circuits, etc. .

From the exterior, two kinds of buzzer seems the same, but a closer look, a slight difference between the height of the active buzzer a, height of 9mm, and passive buzzer b height of 8mm. When the buzzer as the two pins are facing up, you can see there is a green circuit board is passive buzzer, no closed circuit boards with a vinyl is active buzzer .

Further determine the active and passive buzzer, you can also use a multimeter to test the resistance profile Rx1 file:buzzer with black pen then "+" pin, the red pen to touch on another pin back and forth, if trigger a cracking, cracking sound and the resistance only 8Ω (or 16Ω) is passive buzzer; If you can emit continuous sound, and the resistance in Europe and more than a few hundred, and is an active buzzer.

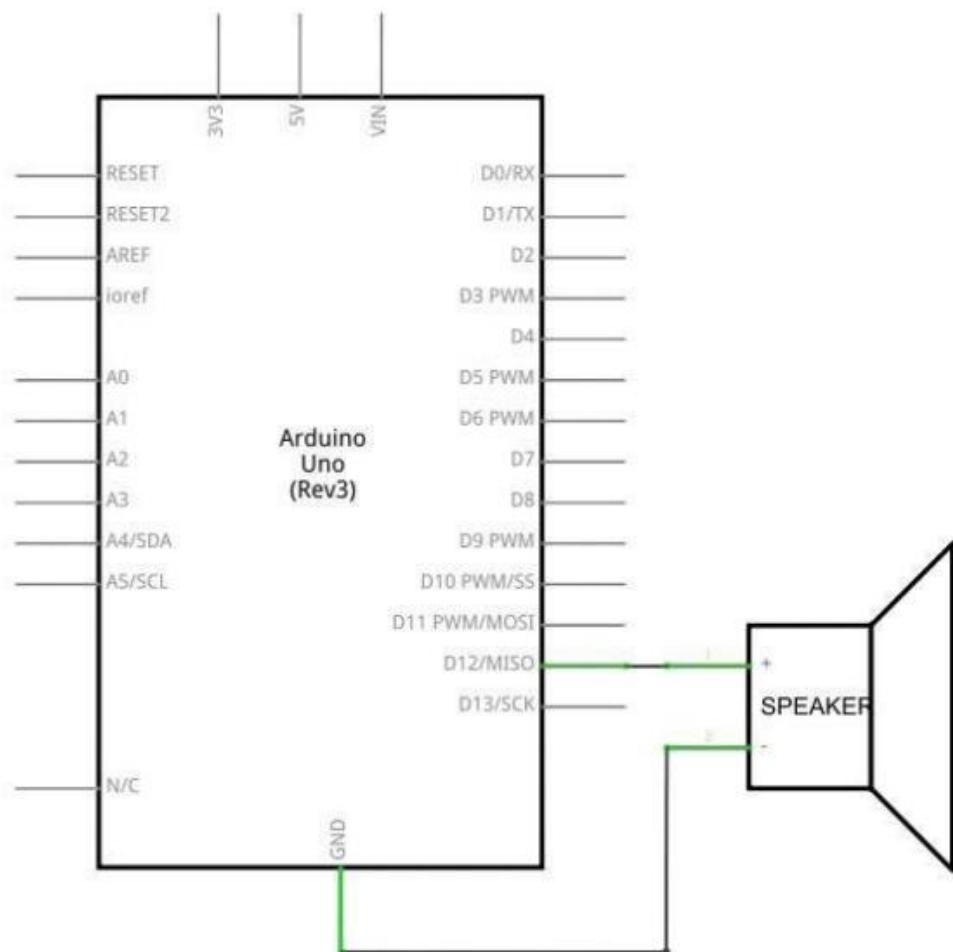

Active buzzer directly connected to the rated power (new buzzer has stated on the label) can be a continuous sound; rather passive

LROBRUYA

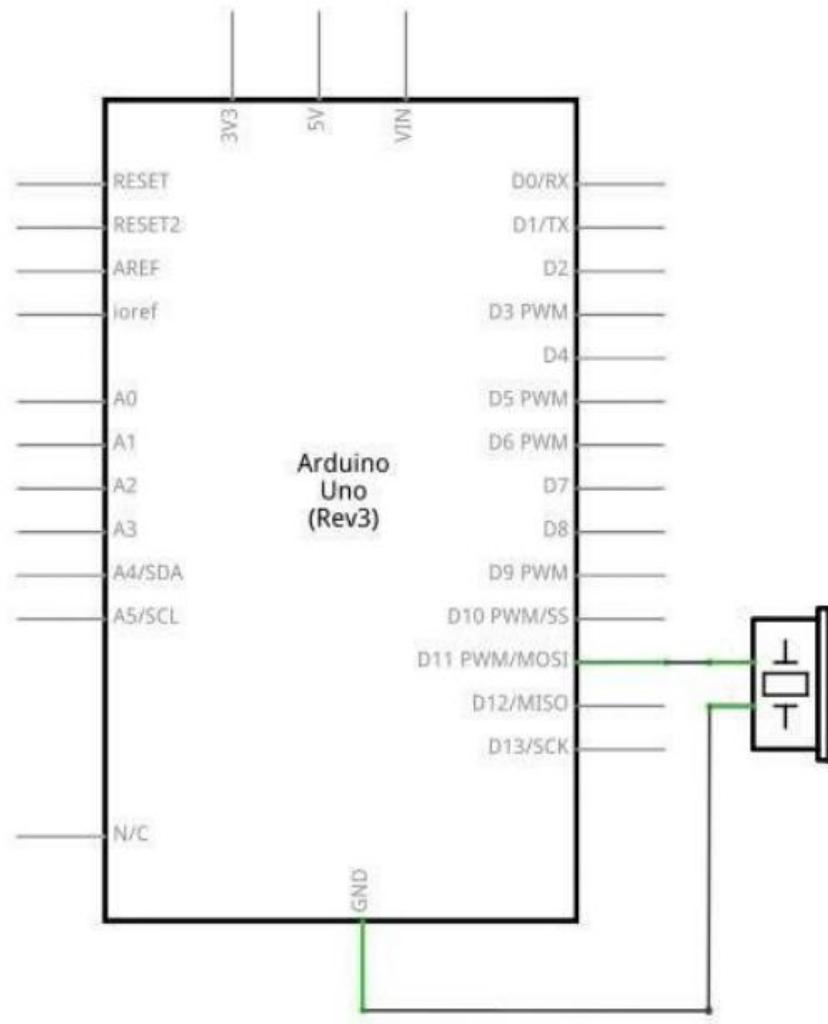

electromagnetic buzzer and speaker are the same, you need to take in order to sound the audio output circuit .

Lesson 9 SMD RGB Module and RGB Module

Overview

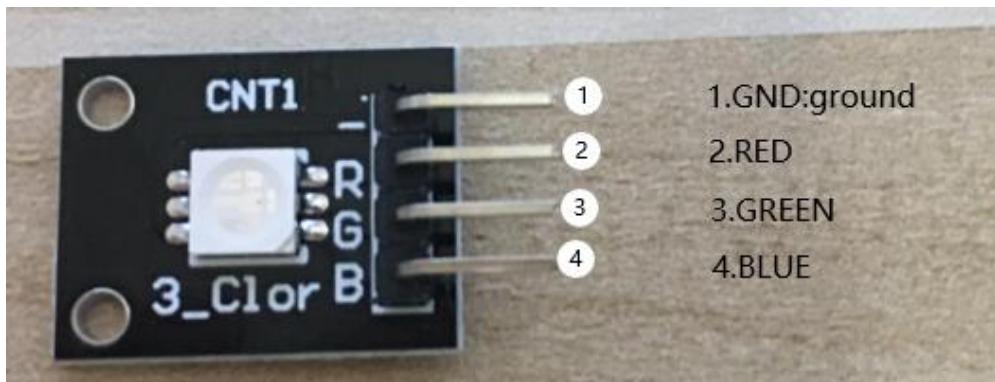

In this experiment, we will learn how to use SMD RGB module and RGB module.

The function of SMD RGB module and RGB module are almost the same. But we can choose the shape we like or we need.

SMD RGB LED module and RGB module are made from a patch of full-color LED. By adjusting the voltage input of R, G, B pins, we can adjust the strength of the three primary colors (red/blue/green) so to implementation result of full color effect.

LROBRUYA

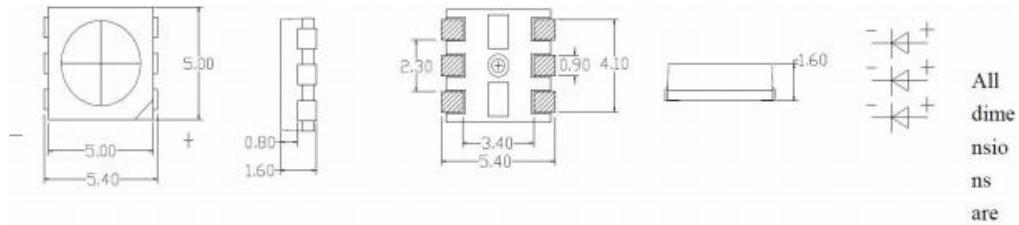

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) SMD RGB module* 1
- (4) RGB module* 1
- (5) Breadboard* 1
- (6) Breadboard Jumper Wires* Several

Component Introduction

you want to make it change the color in different way, you can revise the code.

Lesson 10 Photo-Interrupter Module

Overview

In this experiment, we will learn how to use Photo-interrupter module.

- 1.OUTPUT
- 2.VCC:3.3V-5V DC
- 3.GND:ground

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Photo-interrupter module* 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Opto Interrupter Sensor:

Opto Interrupters are commonly used in many arcade games e.g. steering assembly in older driving games, scoring switches in Whack A Crock etc. Uninterrupted light beam will turn the phototransistor "ON" connecting the ground to the game board input. When the light beam is interrupted the phototransistor turns "OFF" , the ground is disconnected from the input and the pull-up resistor R1 forces the input to go "HIGH" (5V level).

Principle

Lesson 12 Photoresistor Module

Overview

In this experiment, we will learn how to use the photo-resistor module. Photo-resistor is very common in our daily life. It is mainly used in intelligent switch so as to bring convenience to our life. At the same time, in our daily life, we also use it in electronic design. So in order to use it in a better, we provide the corresponding modules to help us to use it more conveniently and efficiently.

1.GND:ground
2.VCC:3.3V-5V DC
3.OUTPUT

Component Required:

(1) LONTEN UNO Board * 1

-
- (2) USB Cable* 1
 - (3) Photoresistor module* 1
 - (4) Breadboard* 1
 - (5) Breadboard Jumper Wires* Several

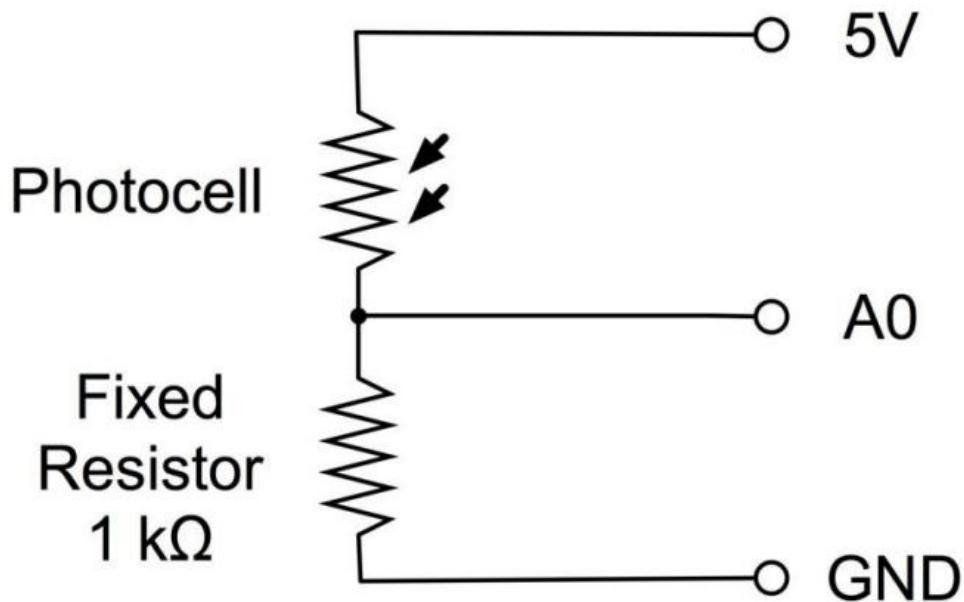

Component Introduction

PHOTOCELL:

The photocell used is of a type called a light dependent resistor, sometimes called an LDR. As the name suggests, these components act just like a resistor, except that the resistance changes in response to how much light is falling on them.

This one has a resistance of about $50\text{ k}\Omega$ in near darkness and $500\text{ }\Omega$ in bright light. To convert this varying value of resistance into something we can measure on an Arduino's analog input, it need to be converted into a voltage.

The simplest way to do that is to combine it with a fixed resistor.

The resistor and photocell together behave rather like a pot. When the light is very bright, then the resistance of the photocell is very low compared with the fixed value resistor, and so it is as if the pot were turned to maximum.

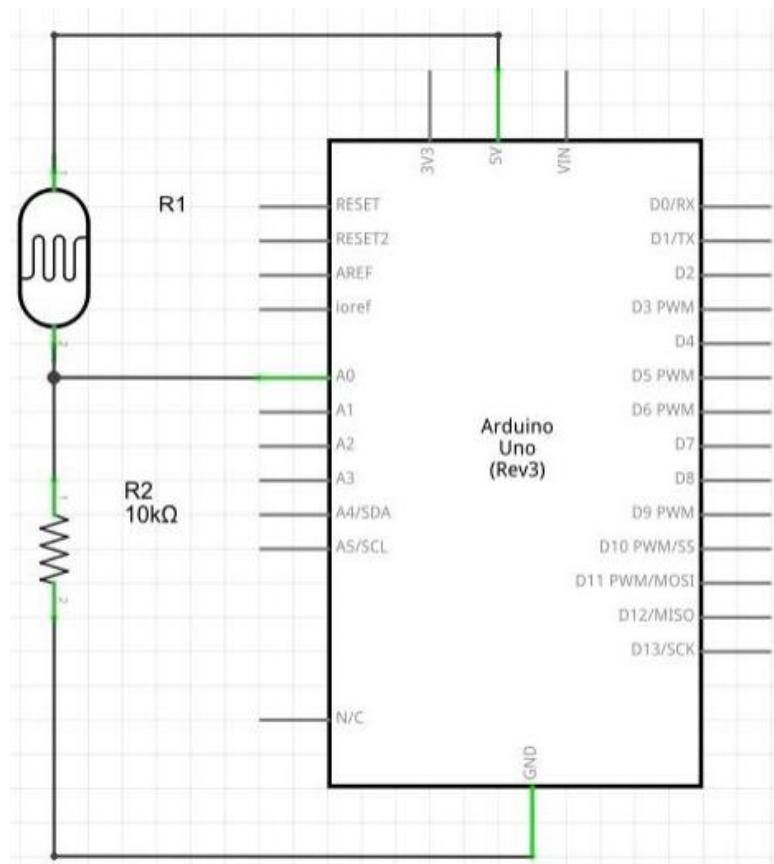

When the photocell is in dull light the resistance becomes greater than the fixed $1\text{k}\Omega$ resistor and it is as if the pot were being turned towards GND.

Load up the sketch given in the next section and try covering the photocell with your finger, and holding it near a light source.

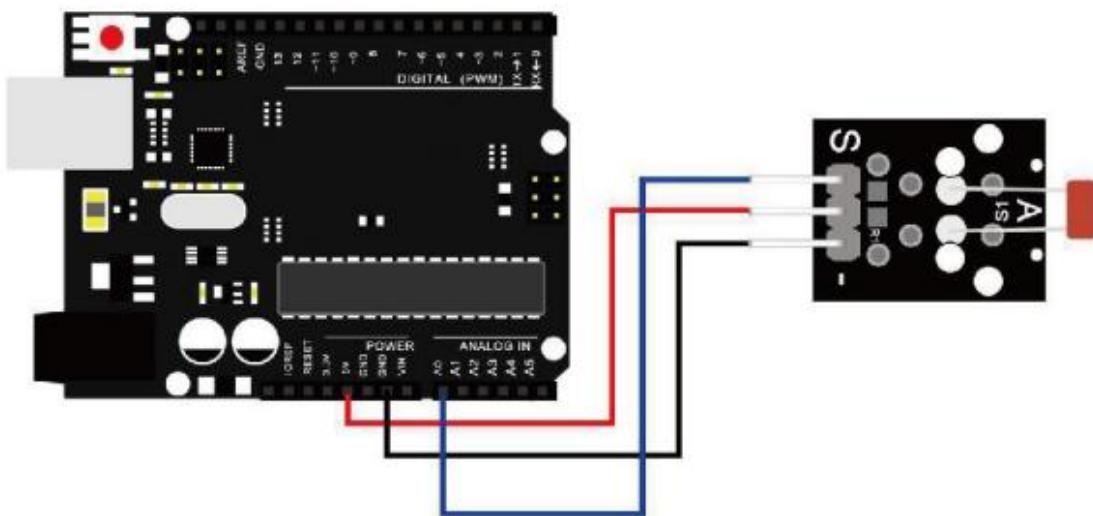

Connection

LROBRYA

In the test, we only read the output analog voltage value of photo-resistor module. In the test results, we will find that when there is lighting, high voltage output equivalently of switch on, when there is no light, low voltage equivalently of switch off. This is what we can use this in practice.

Lesson 13 Big Sound Sensor Module and Small Sound Sensor

Module

Overview

In this experiment, we will learn how to use the High-sensitive Voice Sensor.

- 1.D0:digital output
- 2.VCC: 3.3V-5V DC
- 3.GND:ground
- 4.AO:analog output

- 1.D0:digital output
- 2.VCC: 3.3V-5V DC
- 3.GND:ground
- 4.AO:analog output

Component Required:

- (1) LONTEN UNO Board * 1

-
- (2) USB Cable* 1
 - (3) Big sound sensor module* 1
 - (4) Small sound sensor module* 1
 - (5) Breadboard* 1
 - (6) Breadboard Jumper Wires* Several

Component Introduction

Sound sensor:

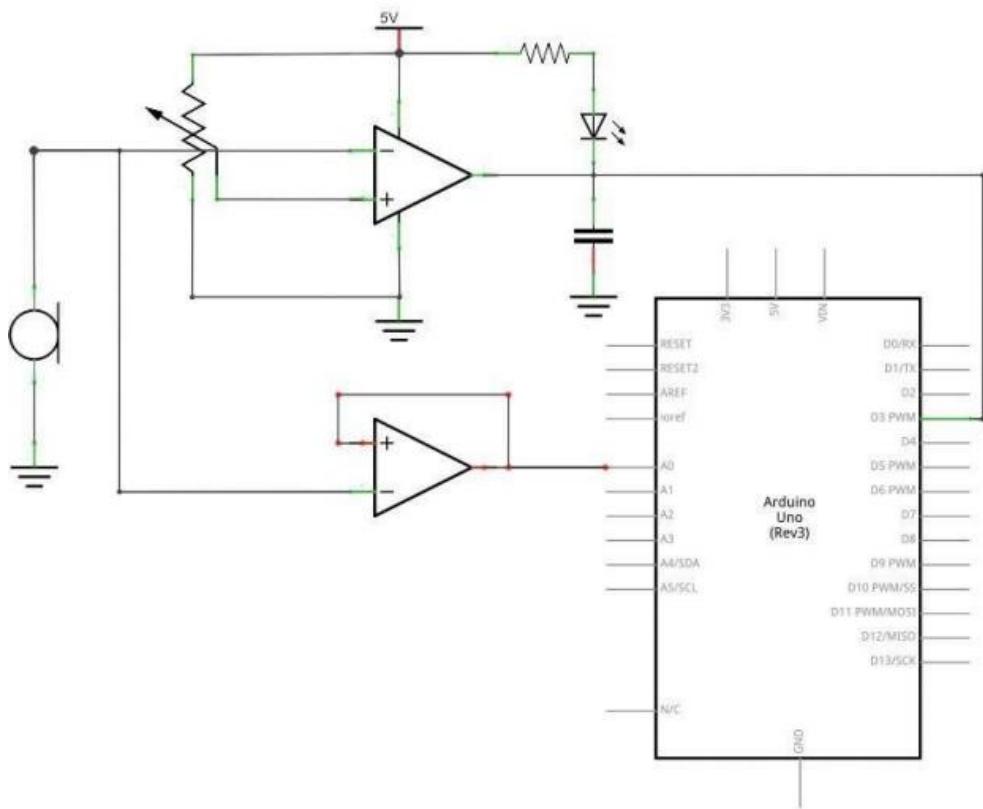

The sound sensor module provides an easy way to detect sound and is generally used for detecting sound intensity. This module can be used for security, switch, and monitoring applications. Its accuracy can be easily adjusted for the convenience of usage.

It uses a microphone which supplies the input to an amplifier, peak detector and buffer. When the sensor detects a sound, it processes an output signal voltage which is sent to a microcontroller then performs necessary processing.

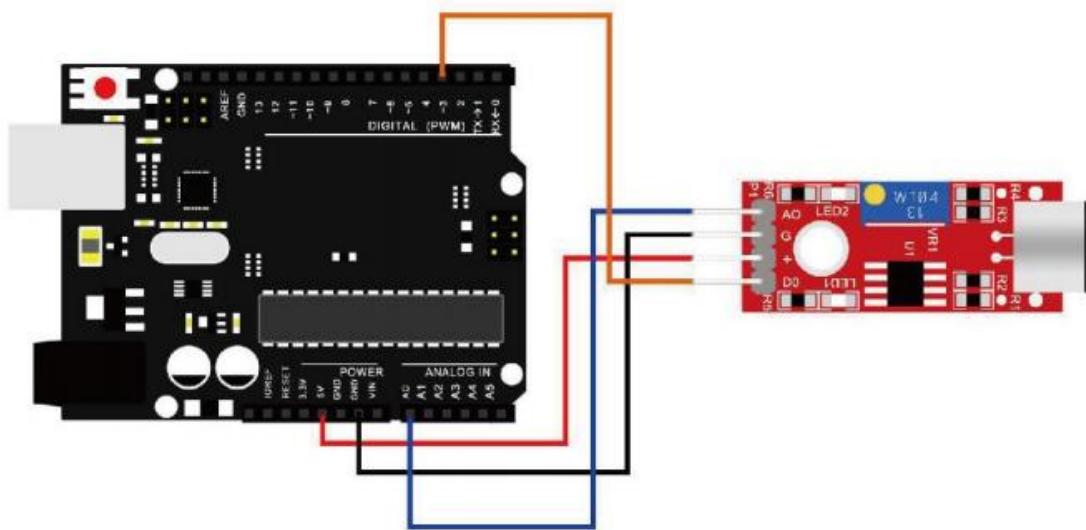

Connection

Schematic

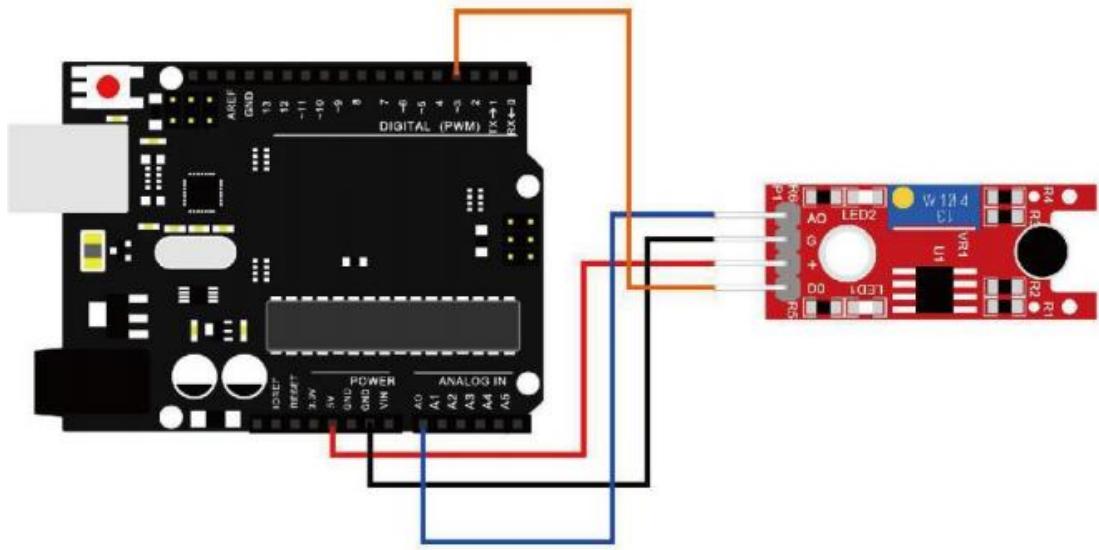

LROBROUYA

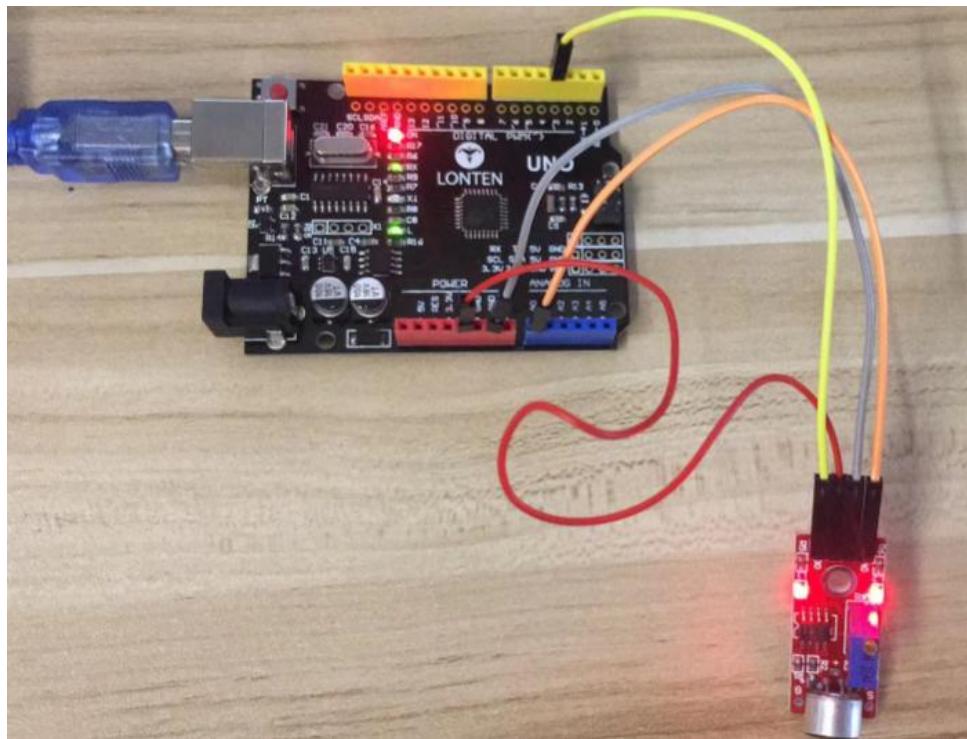

wiring diagram

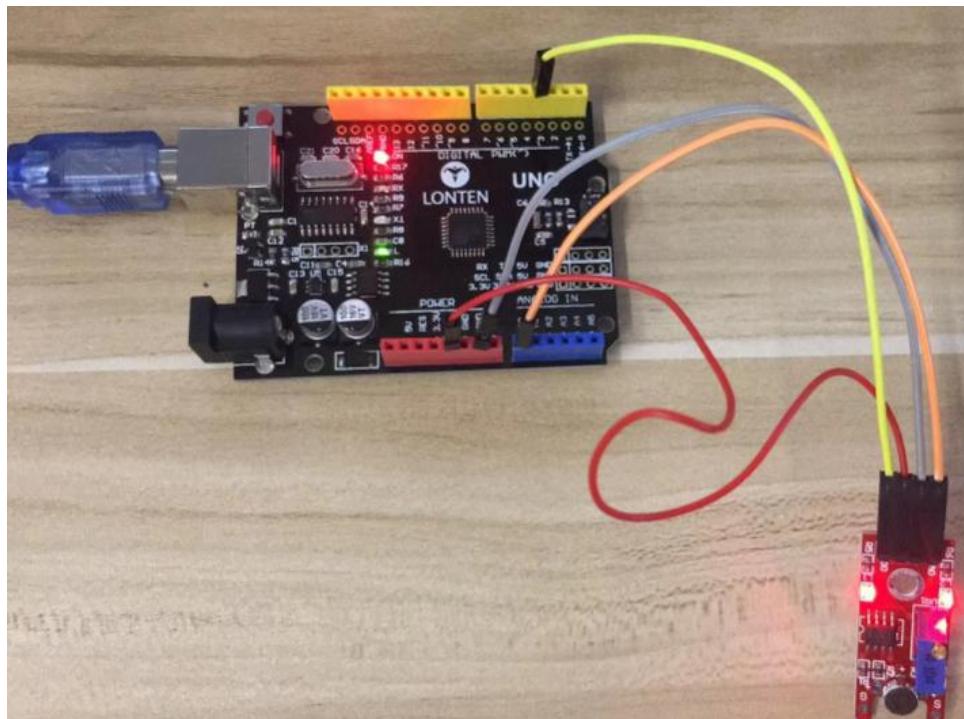

LROBRUYA

Example picture

LROBRYA

Result

High-sensitive Voice Sensor has two output:

AO, analog output, real-time output voltage signal of microphone

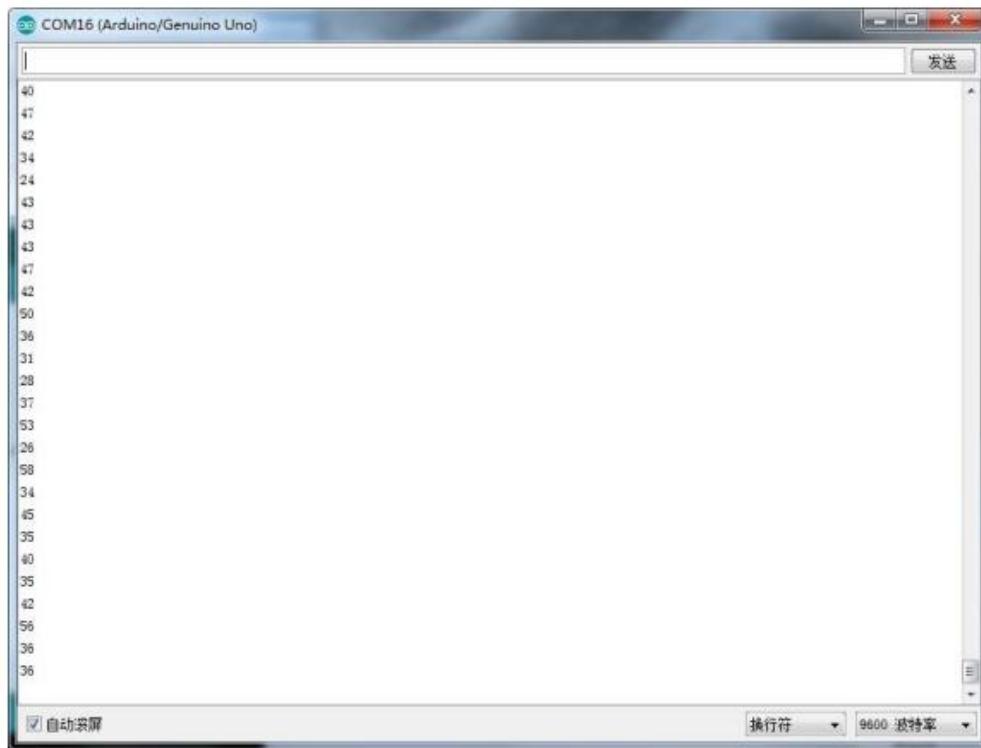

DO, when the intensity of the sound to reach a certain threshold, the output high and low level signal, the threshold-sensitivity can be achieved by potentiometer adjustment period.

The module features:

The installation of 3mm screw holes use 5 v dc power supply have analog output turn a threshold level of output microphone GaoGan degree, high sensitivity. has a power light the comparator output indicator light.

Upload the program then open the monitor, we can see the data as below:

LROBRYA

Lesson 14 Reed Swith and mini Reed

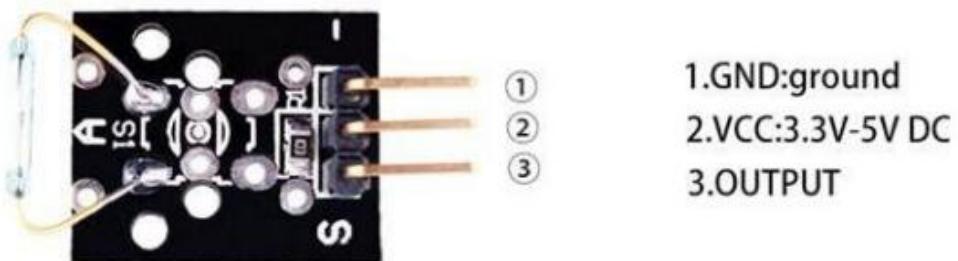

Switch Module

Overview

In this experiment, we will learn how to use reed switch and mini reed switch module.

- 1.DO:digital output
- 2.VCC: 3.3V-5V DC
- 3.GND:ground
- 4.AO:analog output

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Reed switch module* 1
- (4) Mini Reed switch module* 1
- (5) Breadboard* 1
- (6) Breadboard Jumper Wires* Several

Component Introduction

Reed Switch and Reed Sensor Activation:

Although a reed switch can be activated by placing it inside an electrical coil, many reed switches and reed sensors are used for proximity sensing and are activated by a magnet. As the magnet is brought into the proximity of the reed sensor/switch, the device activates. As the magnet is removed from the proximity of the reed sensor/switch, the device deactivates. However, the magnetic interaction involved in activating the reed switch contacts is not necessarily obvious. One way of thinking

LROBRYA

about the interaction is that the magnet induces magnetic poles into the metal parts of the reed switch and the resulting attraction between the electrical contacts causes the reed switch to activate.

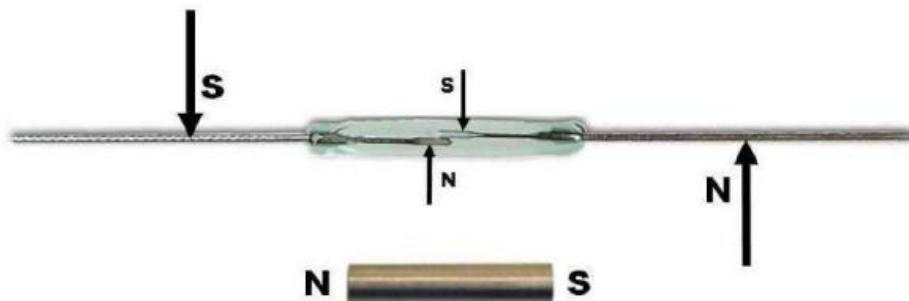

Figure 1 – Magnetic Induction

Another equally valid way of thinking about the interaction between a magnet and a reed switch is that the magnet induces magnetic flux through the electrical contacts. When the magnetic flux is high enough, the magnetic attraction between the contacts causes the reed switch to close.

Figure 2 – Magnetic Flux

The following are examples of typical reed switch and reed sensor activate distances.

Difference between the reed switch module and mini reed switch module

LROBRYA

As we can see, the reed switch module is bigger than the mini reed switch module. So the bigger one may have more function than the mini one. The reed switch can output in two ways: digital and analog. The mini reed can only output in digital.

In the 37 sensor kit, there have 7 red pcb modules. The difference between the red and small pcb is same as above.

Principle

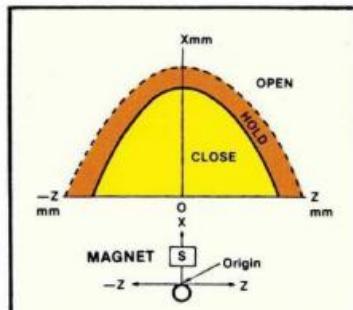

Figure 3 – Magnet Parallel to Reed Sw.

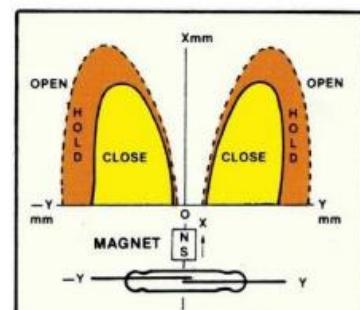

Figure 4 – Magnet Perpendicular to Reed Sw.

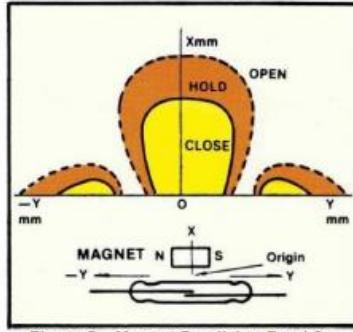

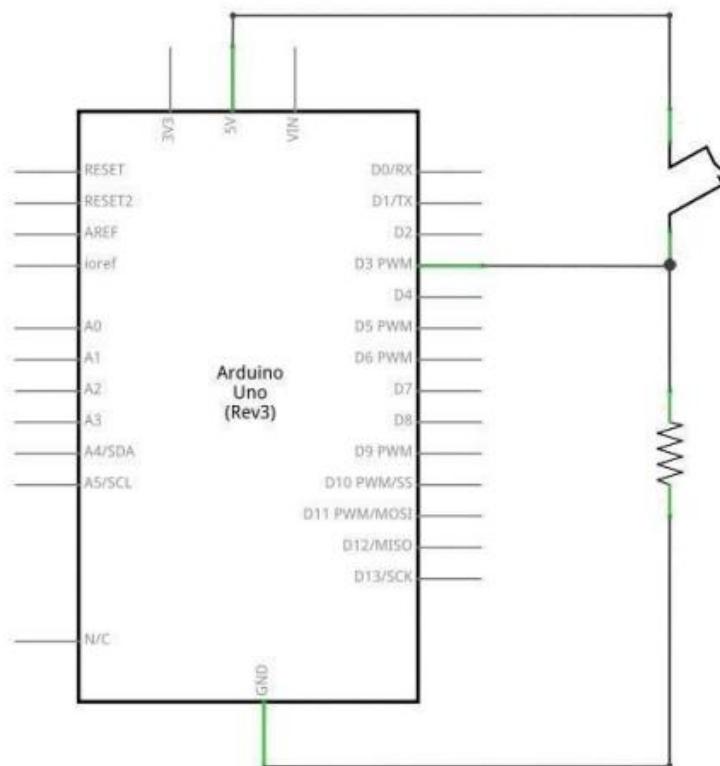

Figure 5 – Magnet Parallel to Reed Sw.

As can be seen, the magnetic orientation and location relative to the reed switch play important roles in the activation distances. In addition, the size of the activate regions(lobes) will vary depending on the strength of the magnet and the sensitivity of the reed switch. Proper orientation of the

magnet with respect to the reed sensor/switch is an important consideration in meeting the application's requirements across the tolerance range for mechanical systems, magnetic strength and reed sensor or reed switch sensitivity.

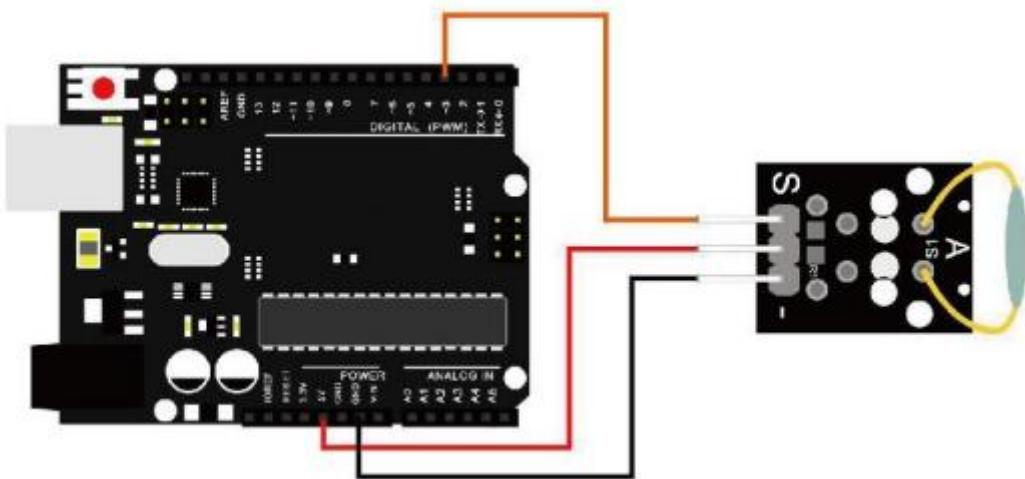

Connection of mini reed switch module

Schematic

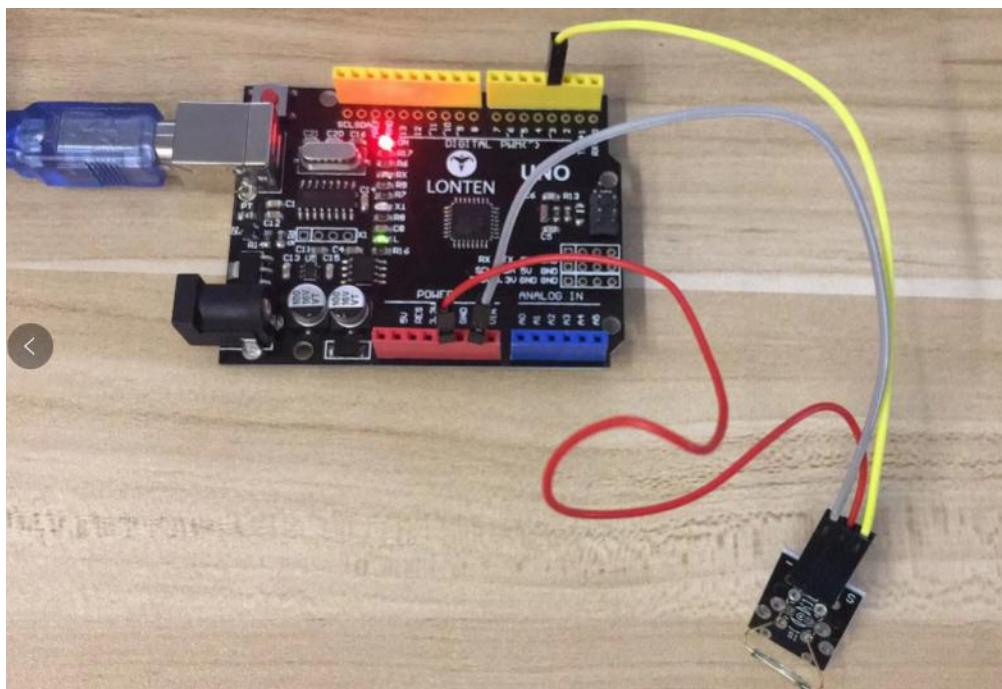

wiring diagram

LROBRYA

Example picture

Result

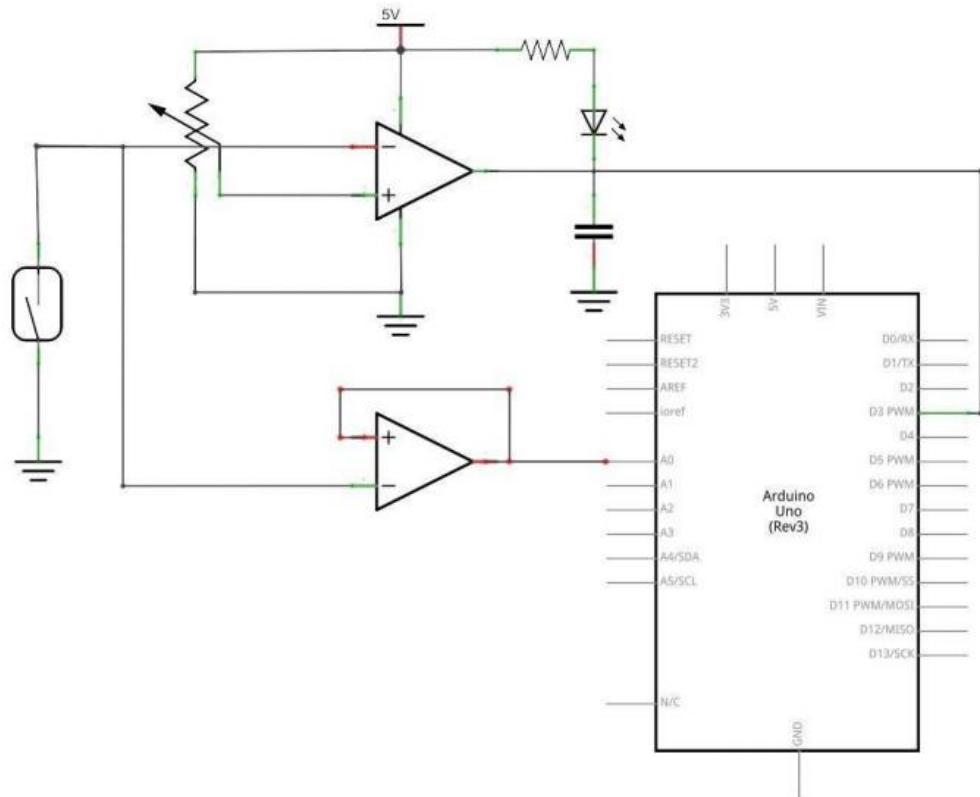

Upload the program, When the module access to magnetic, you can see the led on or off. Mini switch module and number 13 port have the built-in LED simple circuit. To produce a switch flasher, we can use

LROBRYA

connect the digital port 13 to the built-in LED and connect the switch module S port to number 3 port of LONTEN Uno board. When the switch sensing, LED twinkle light to the switch signal.

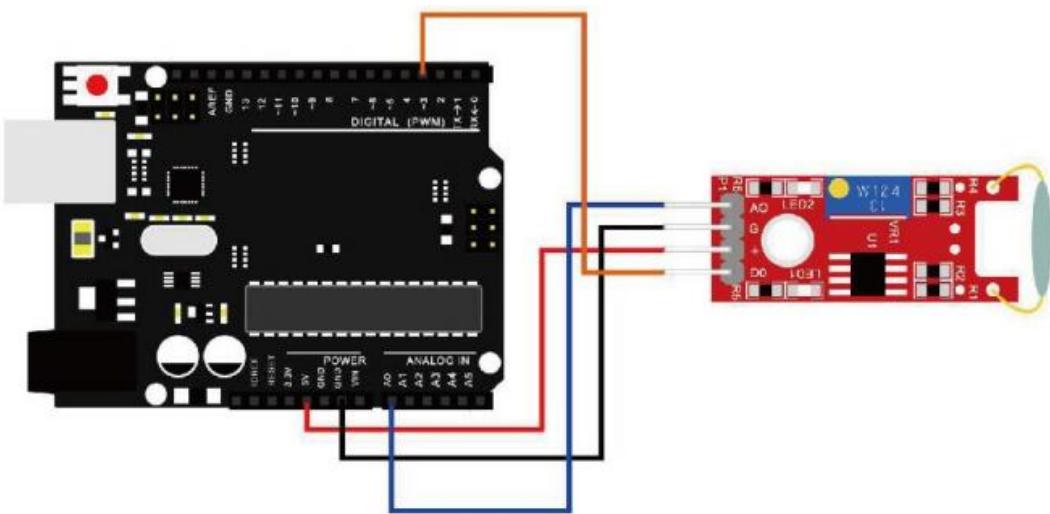

Connection of reed switch module

Lesson 15 Digital Temperature Module

Overview

In this experiment, we will learn how to use digital temperature module and analog temp module.

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) digital temperature module* 1
- (4) temperature module * 1
- (5) Breadboard* 1
- (6) Breadboard Jumper Wires* Several

Component Introduction

Thermistor:

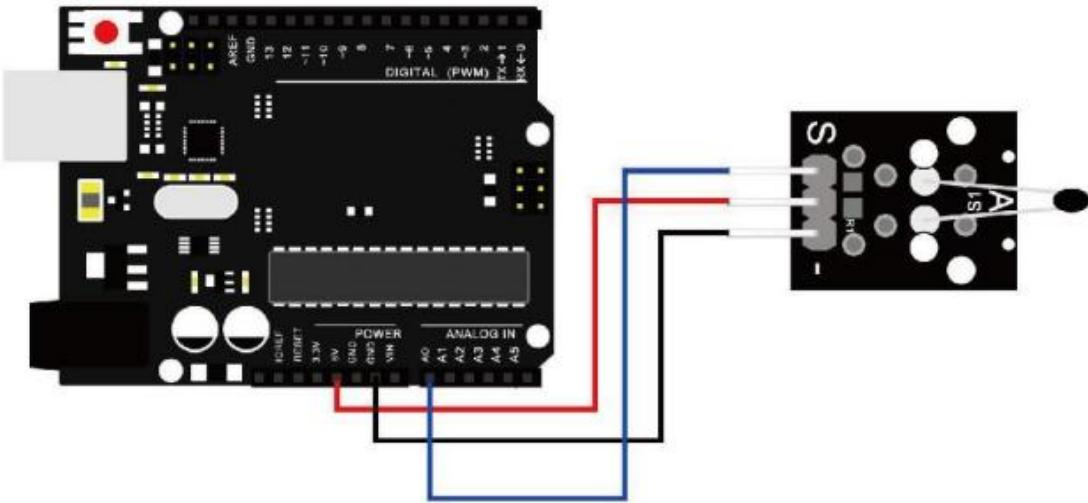

These thermistors have a narrow tolerance on the B-value, the result of which provides a very small tolerance on the nominal resistance value over a wide temperature range. For this reason the usual graphs of $R = f(T)$ are replaced by Resistance Values at Intermediate Temperatures Tables, together with a formula to calculate the characteristics with a high precision.

RS stock no.	151-215	151-221	151-237	151-243
Resistance at +25°C	3kΩ	5kΩ	10kΩ	100kΩ
Temperature range	-55°C to +150°C

$$V_{\text{Hall}} \propto I_C \times H$$

V_{Hall} = Output Hall-effect voltage

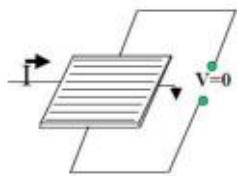

H = Magnetic Flux created by magnet or current-carrying conductor

I_C = Constant supply current

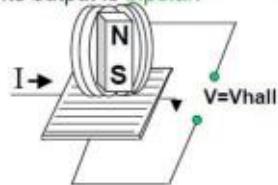

LROBRYA

Hall-effect Sensing Mechanism

- The current source is applied through a thin sheet of semiconductor material.

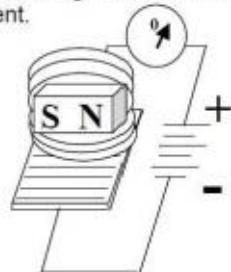

- A magnetic field applied **perpendicular** to the element creates a voltage change = V_{Hall} . Its output is **bipolar**.

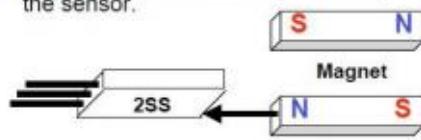

Magnetoresistive Sensing Mechanism

- A magnetic field applied **parallel** to the element changes its resistance and creates a current.

- MR is **omnipolar**—either pole will operate the sensor.

Design Factors – Magnetic Types

Unipolar: Only a south pole will operate the sensor. Thiessens or turns on with the south pole(+) and off when the south pole is removed.

- Bipolar: Sensor output is pole-dependent. A south pole (+) is designed to activate the sensor; a north pole(-) is designed to deactivate. It's possible that the sensor could turn off and still be within a positive Gauss level.

• Latching: Specifications are tighter on latching. Sometimes it is designed

to make certain that when the south pole(+) is removed from the sensor, it will stay on until it sees the opposite pole(-).

- Omnipolar: The sensor is designed to operate with either magnetic pole(+ or -).

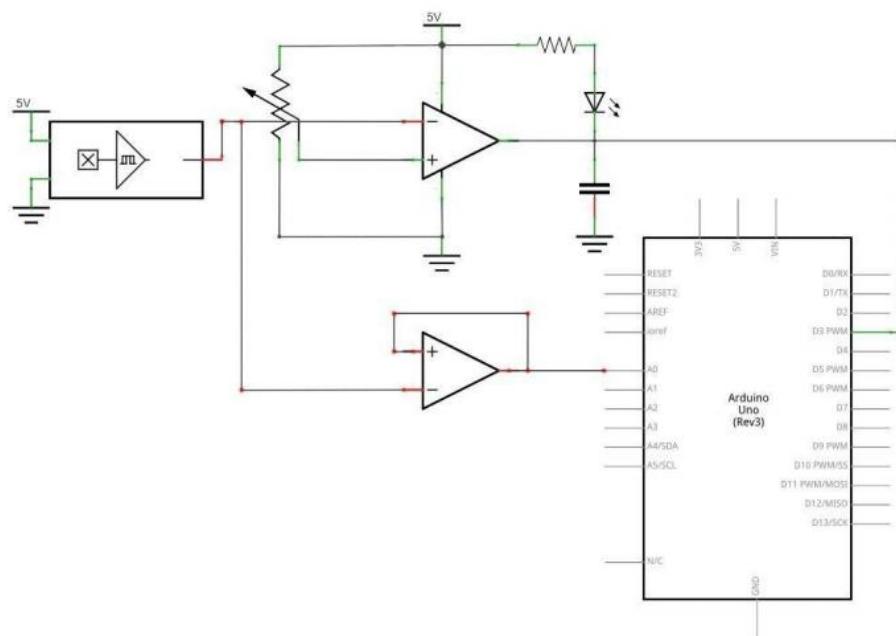

LROBRYA

- Ratiometric linear: Output is proportional to magnetic field strength.

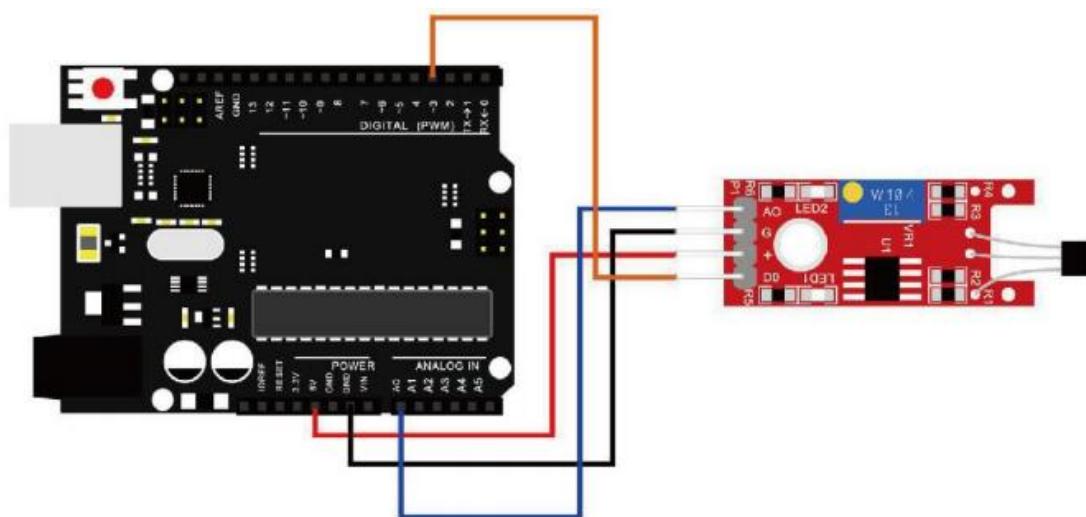

Output sensitivity range is 2.5 – 3.75 mV per unit of Gauss.

Connection

Lesson 21 Joystick Module

Overview

Just like a joystick on game console, you can control x, y and z dimensions input by this joystick module. It can be considered as combination of potentiometers and one button. Data type of the x, y dimensions are analog input signals and z dimension is digital input signal. thus the x and y ports connect to analog pins of Sensor Shield, while z port connects to digital pin.

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Joystick module* 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Joystick sensor:

Lots of robot projects need joystick. This module provides an affordable solution. By simply connecting to two analog inputs, the robot is at your commands with X, Y control. It also has a switch that is connected to a digital pin. This joystick module can be easily connected to Arduino by IO Shield. This module is for Arduino (V5) with cables supplied.

Specification

Supply Voltage: 3.3V to 5V

Interface: Analog x2, Digital x1

Size: 40*28mm

Weight: 12g

The module has 5 pins: Vcc, Ground, X, Y, Key. Note that the labels on yours may be slightly different, depending on where you got the module from. The thumb stick is analog and should provide more accurate readings than simple 'directional' joysticks that use some form of buttons, or mechanical switches. Additionally, you can press the joystick down (rather hard on mine) to activate a 'press to select' push-button.

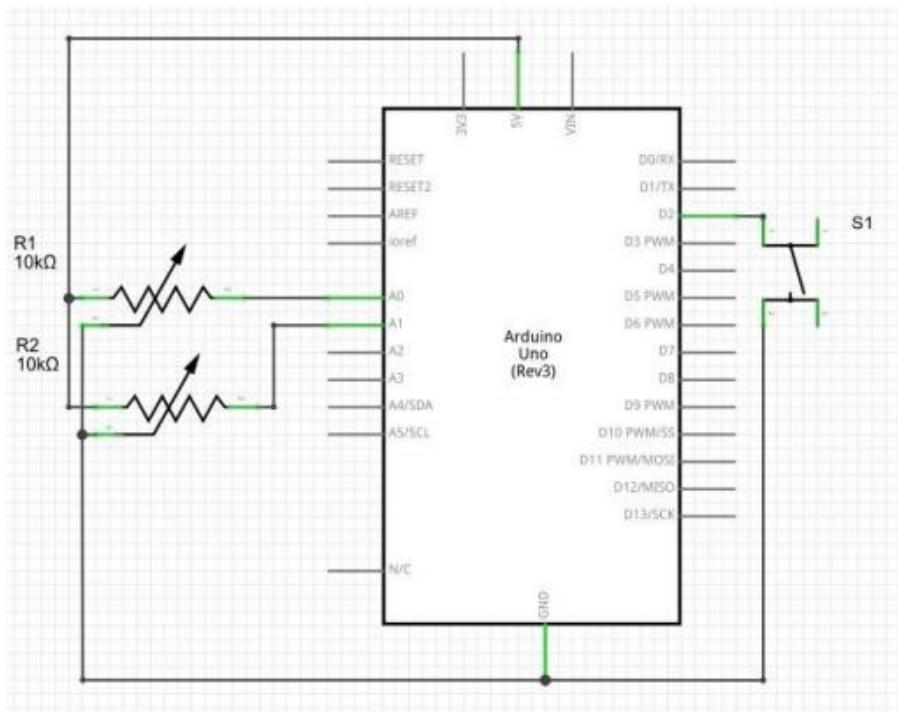

We have to use analog Arduino pins to read the data from the X/Y pins, and a digital pin to read the button. The Key pin is connected to ground,

LROBRYA

when the joystick is pressed down, and is floating otherwise. To get stable readings from the Key /Select pin, it needs to be connected to Vcc via a pull-up resistor. The built in resistors on the Arduino digital pins can be used. For a tutorial on how to activate the pull-up resistors for Arduino pins, configured as inputs

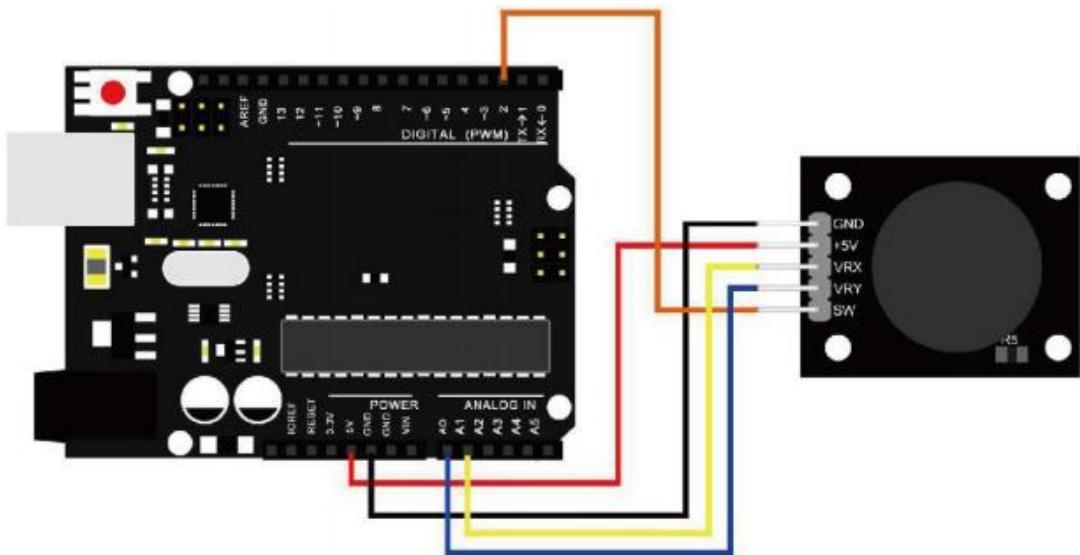

Connection

Schematic

wiring diagram

Example picture

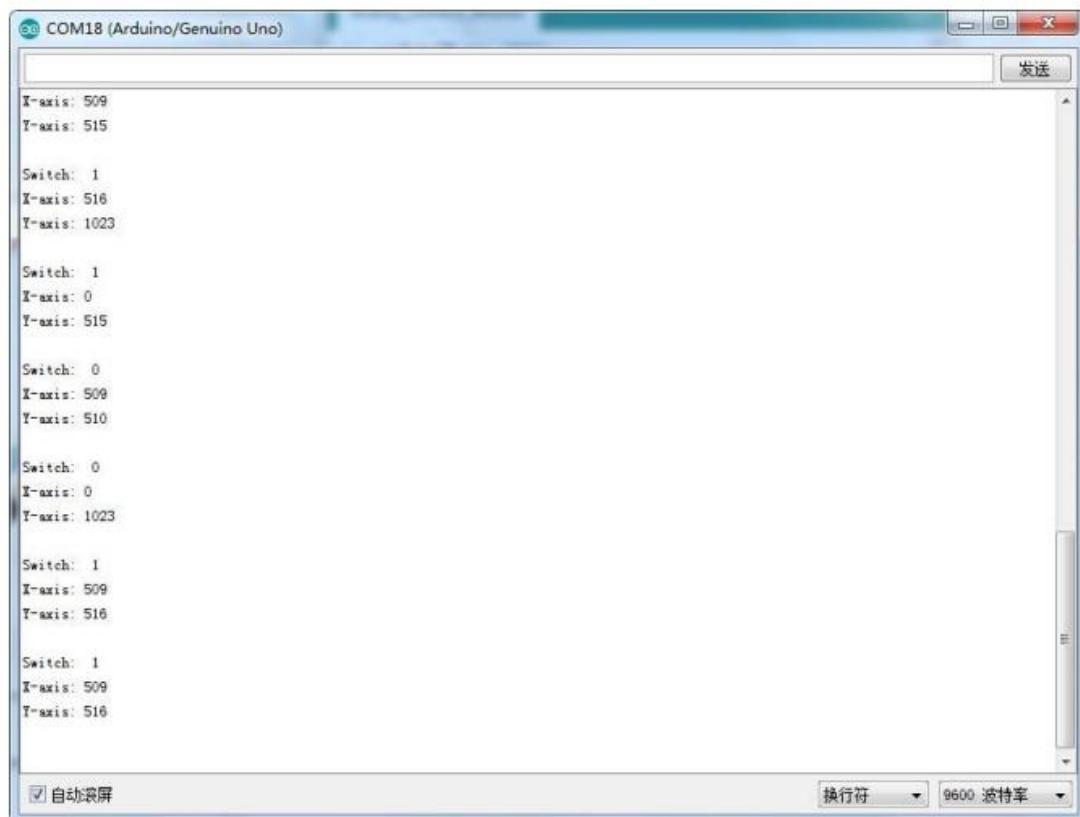

LROBRYA

Result

Analog joysticks are basically potentiometers so they return analog values.

When the joystick is in the resting position or middle, it should return a value of about 512. The range of values go from 0 to 1024.

The screenshot shows the Arduino Serial Monitor window titled "COM18 (Arduino/Genuino Uno)". The window displays a series of data lines. Each line starts with a status indicator (green for received, red for sent, blue for error), followed by the text "Switch: " and a value (either 0 or 1). This is followed by "X-axis: " and a value (ranging from 509 to 516), and "Y-axis: " and a value (ranging from 510 to 1023). The data is repeated seven times. At the bottom of the window, there is a checkbox labeled "自动滚屏" (Auto Scroll) with a checked mark, and two dropdown menus for "换行符" (Line Break) and "9600 波特率" (9600 Baud Rate).

Upload the program then open the monitor, we can see the data.

Lesson 23 Infrared 38KHz Obstacle Avoidance Module

Overview

Non logic chip oscillation frequency regulation 38KHz detection circuit.

This infrared 38KHZ obstacle avoidance module can completely block the traditional photoelectric obstacle detection distance and a single normally open or normally closed signal output function.

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Obstacle avoidance module * 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Obstacle avoidance module:

Specifications

Working voltage: DC 3.3V-5V

Working current: $\geq 20\text{mA}$

Operating temperature: $-10\text{ }^{\circ}\text{C} - +50\text{ }^{\circ}\text{C}$

detection distance :2-40cm

IO Interface: 4-wire interfaces (- / + / S / EN)

Output signal: TTL level (low level there is an obstacle, no obstacle high)

Adjustment: adjust multi-turn resistance

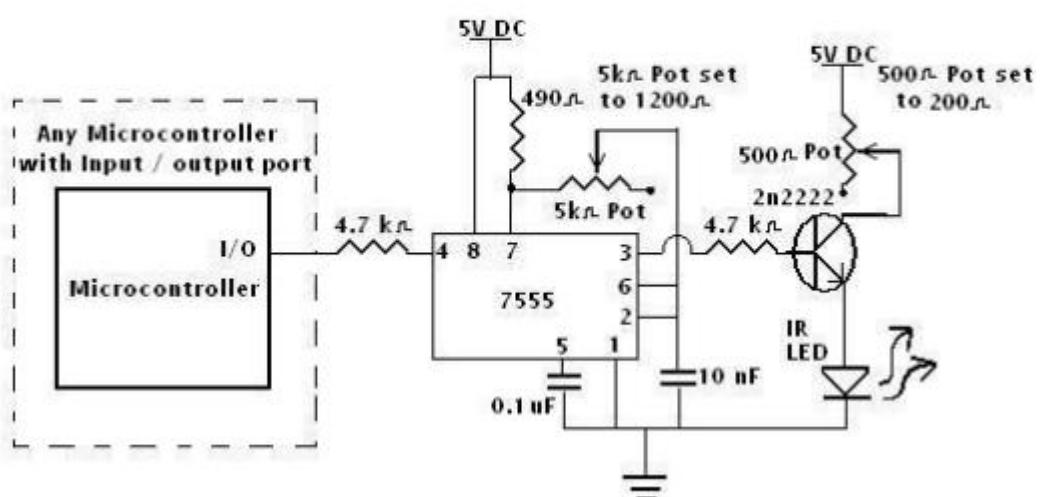

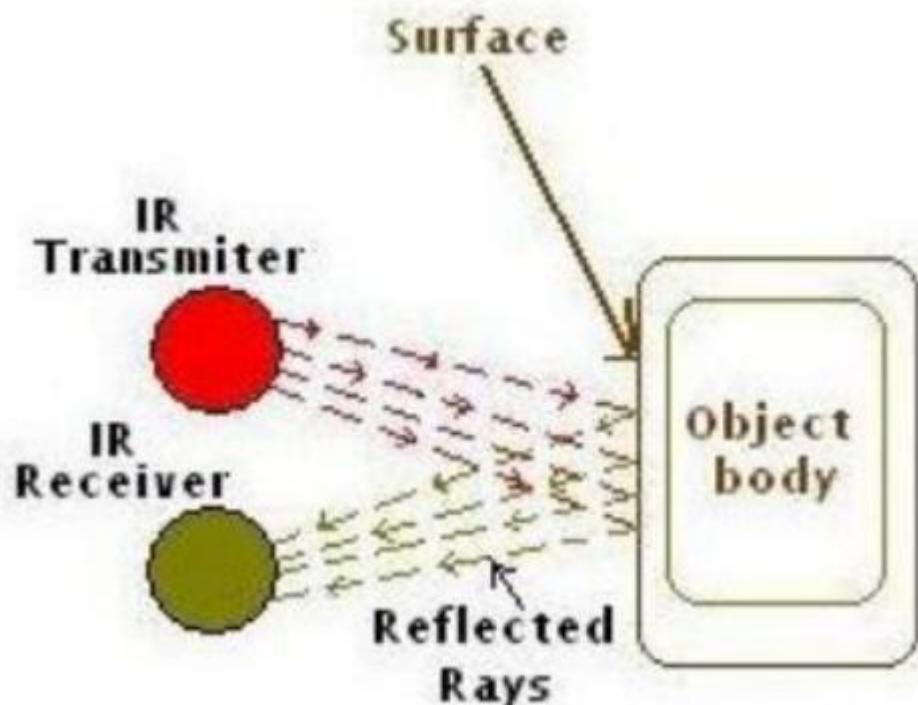

Effective angle: 35 °

Size: $28\text{mm} \times 23\text{mm}$

Weight Size:9g

The basic concept of IR(infrared) obstacle detection is to transmit the IR signal(radiation) in a direction and a signal is received at the IR receiver when the IR radiation bounces back from a surface of the object.

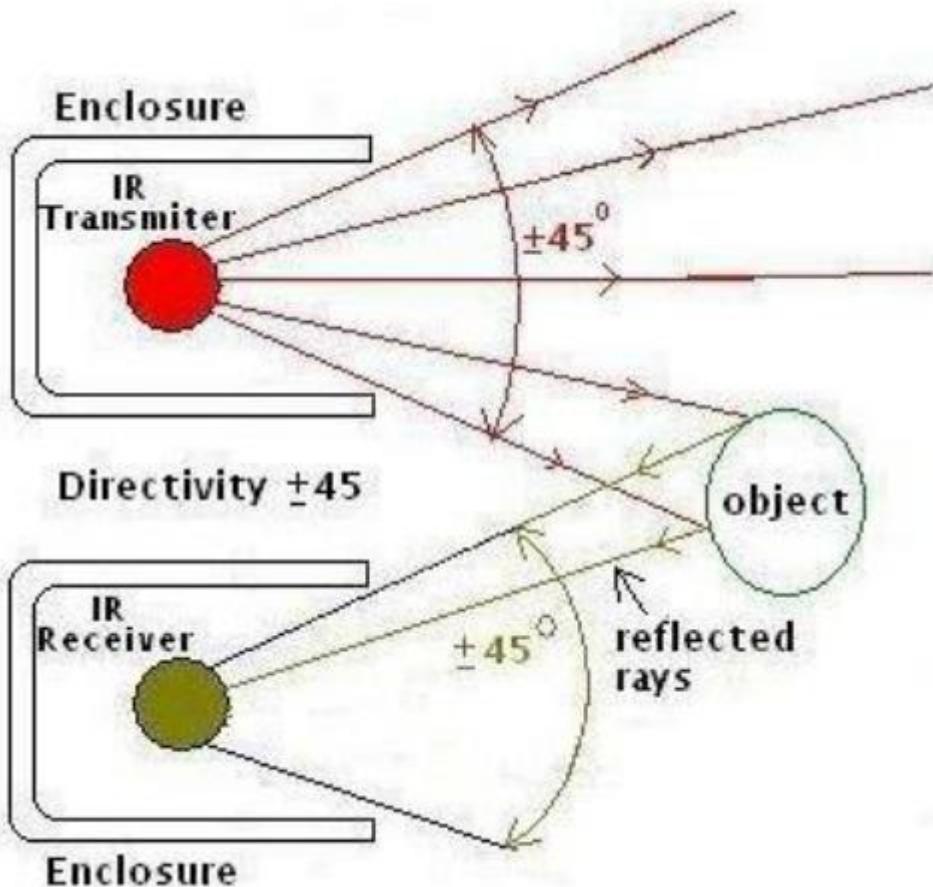

LROBRUYA

There are two potentiometers on the module one controlling operating frequency (centered at 38 kHz) the other controlling intensity. The detector was designed for 38 kHz and the onboard oscillator circuit is

LROBRYA

based on a 555 timer. Tweaking gives a little better range but I'd suggest leaving it alone because the useful range is narrow.

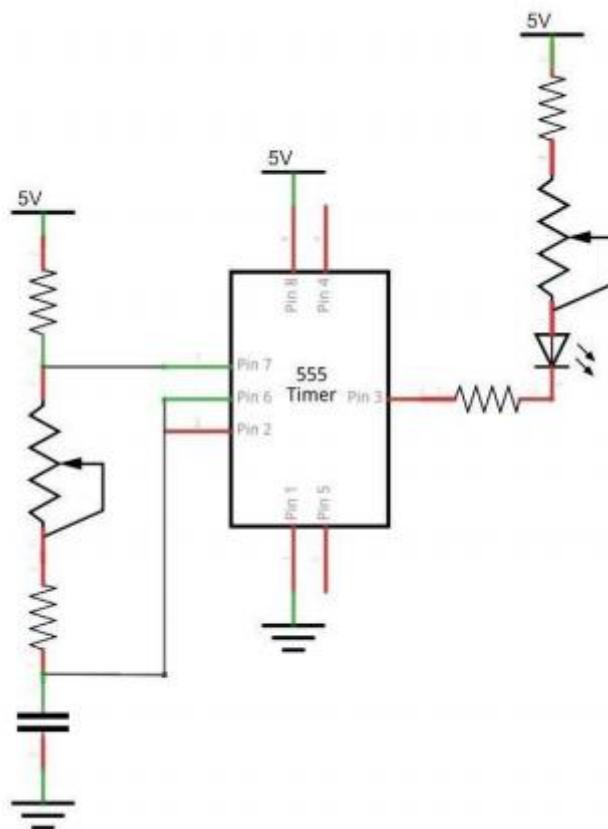

Infrared obstacle avoidance sensor is designed for the design of a wheeled robot obstacle avoidance sensor distance adjustable. This ambient light sensor Adaptable, high precision, having a pair of infrared transmitter and receiver, transmitter tubes emit a certain frequency of infrared, When detecting the direction of an obstacle (reflector), the infrared receiver

LROBRYA

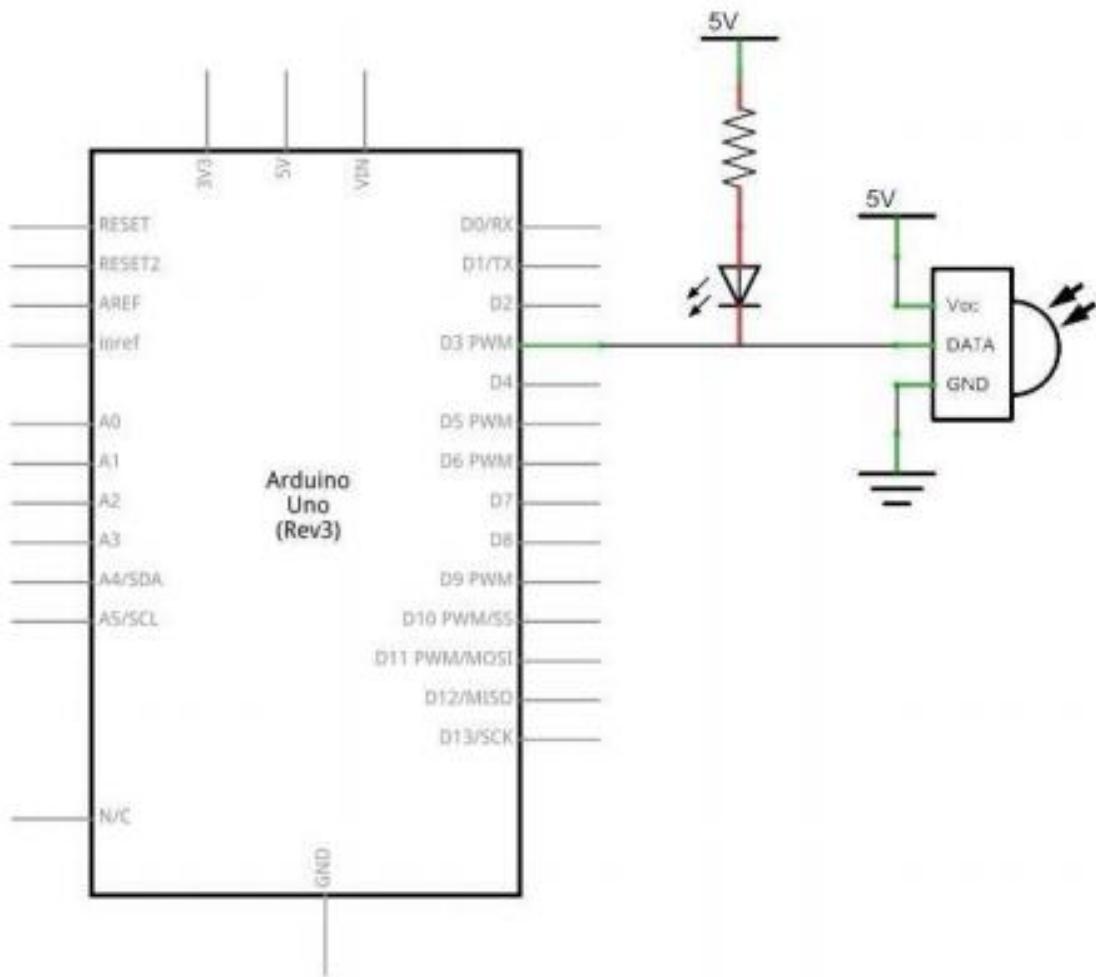

tube receiver is reflected back, when the indicator is lit, Through the circuit, the signal output interface output digital signal that can be detected by means of potentiometer knob to adjust the distance, the effective distance From 2 ~ 40cm, working voltage of 3.3V-5V, operating voltage range as broad, relatively large fluctuations in the power supply voltage of the situation Stable condition and still work for a variety of microcontrollers, Arduino controller, BS2 controller, attached to the robot that Can sense changes in their surroundings.

Connection

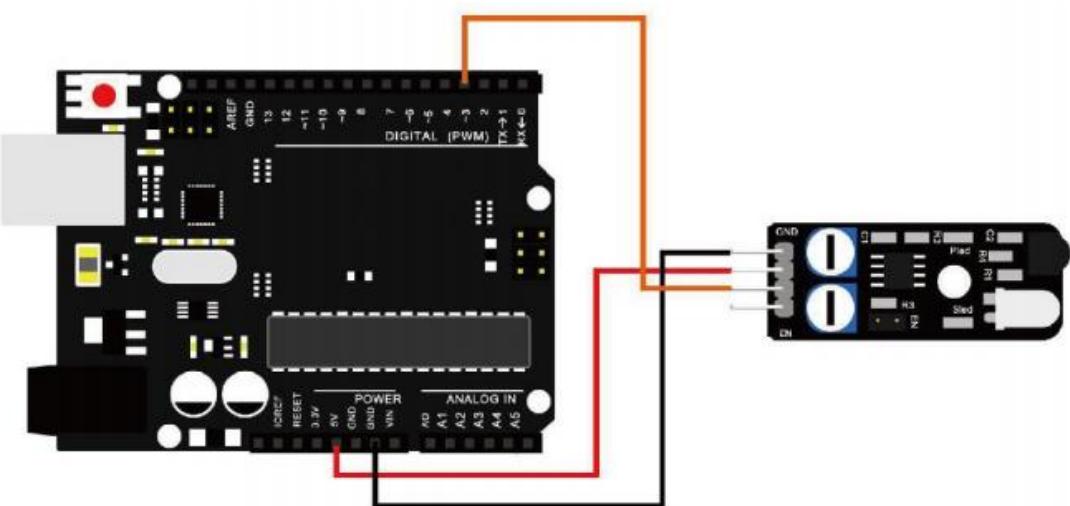

Schematic

wiring diagram

LROBROUYA

Example picture

Result

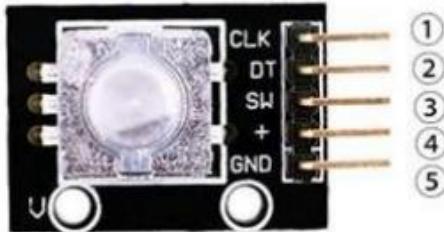

Here we use the obstacle avoidance module and a digital interface, built-in 13 LED build a simple circuit, making avoidance warning lamp, the obstacle avoidance Sensor Access Digital 3 interface, when obstacle avoidance sensor senses a signal, LED light, and vice versa off.

Lesson 24 Rotary Encoders Module

Overview

In this experiment, we will learn how to use the rotary encoders module.

LROBRYA

1.CLK
2.DT
3.SW
4.VCC:3.3V-5V DC
5.GND:ground

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Rotary Encoders module * 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Rotary Encoders:

Mechanical Specifications:

- Operating Temp: -10°C to 70°C
- Storage Temp: -40°C to 85°C
- Rotational Torque: 50gf.cm max.
- No. and Pos. of detents: 12 detents (Step angle 30°±3°)
- Terminal Strength: A static load for 300gf.cm shall be applied to the tip of the terminals for 10 sec. in any direction
- Shaft push-pull strength: 5.1kgf
- Rotational life: 30,000 cycles

Note:

- RoHS Compliant

Electrical Specifications:

- Rating: 1mA/10VDC
- Insulation Resistance: 50VDC 10MΩ Min.
- Dielectric Strength: 50VAC for 1 min.
- Resolution: 12 pulses/360° for each phase

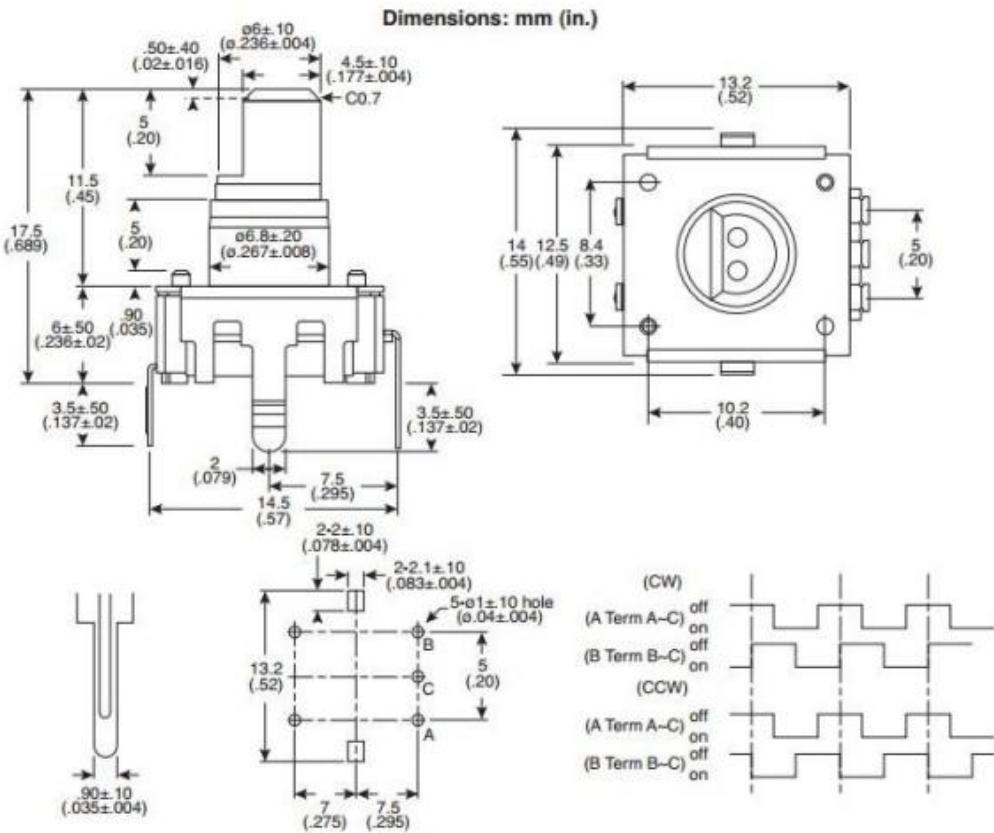

Soldering Specifications:

- Soldering: To be performed in 5 seconds within 260±5°C
- Manual Soldering: To be performed in 3 seconds within 350±5°C
- Preheating: The entire flow duration should not exceed 2 min., and soldering surface temperature (undersurface of PCB) shall be settled within 100°C

Push-on Switch Specifications:

- Type: Single Pole Single Throw (Push on)
- Rating: 10mA/5VDC
- Switch Travel (mm): 0.5±0.4
- Operating Force: 200–460gf
- Operating Life: 20,000 times

LROBRYA

Principle

Incremental encoder

Incremental encoders give two-phase square wave, the phase difference between them 90 °, often referred to as A and B channels. One of the channels is given and speed-related Information, at the same time, by sequentially comparing two channel signals, the direction of rotation of the information obtained. There is also a special signal called Z or Zero channel, which gives the absolute zero position encoder, the signal is a square wave with the center line of channel A square wave coincide.

Clockwise counterclockwise

LROBREUYA

A	B
1	1
0	1
0	0
1	0
1	1
1	0
0	0
0	1

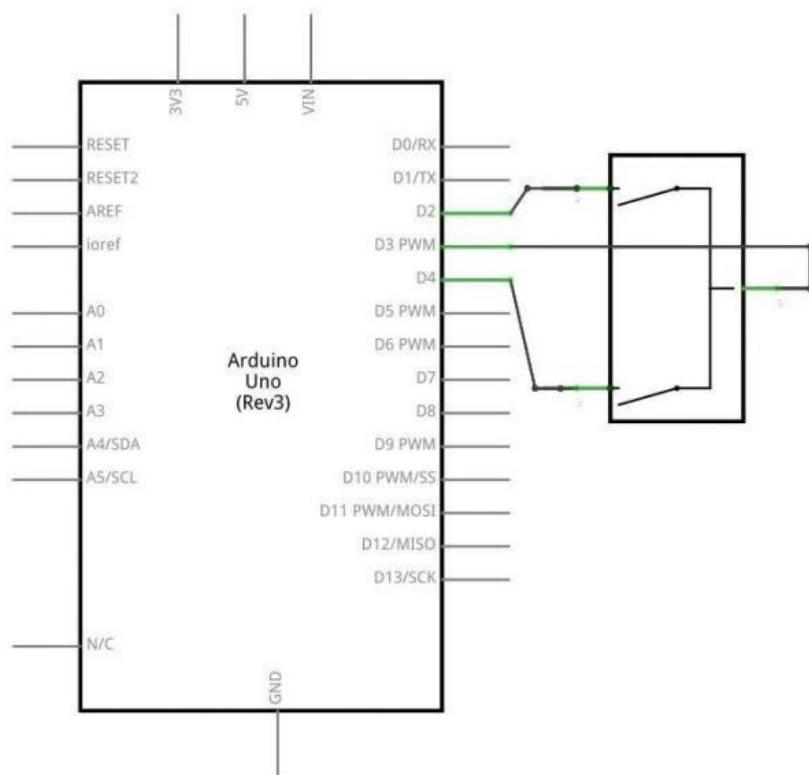

Incremental encoder accuracy depends on the mechanical and electrical two factors, these factors are: Raster indexing error, disc eccentricity, bearing eccentricity, e-reading Several means into the optical portion of the errors and inaccuracies. Determine the encoder resolution is measured in electrical degrees, the encoder accuracy depends Set the pulse encoder generates indexing. The following electrical degrees with a 360° rotation of the shaft to said machine, and rotation of the shaft must be a full week of Period. To know how much electrical equivalent of the mechanical angle of 360 degrees can be calculated with the following formula:

$$\text{Electrical } 360 = \text{Machine } 360^{\circ} / n^{\circ} \text{ pulses / revolution}$$

Encoder indexing error is the electrical angle of the unit two successive pulse maximum offset to represent. Error exists in any encoder, which is caused by the aforementioned factors. Eltra encoder maximum error is ± 25 electrical degrees (declared in any condition), equivalent to the rated Offset values $\pm 7\%$, as the phase difference 90° (electrical) of the two channels of the maximum deviation ± 35 electrical degrees is equal to $\pm 10\%$ deviation left Ratings Right.

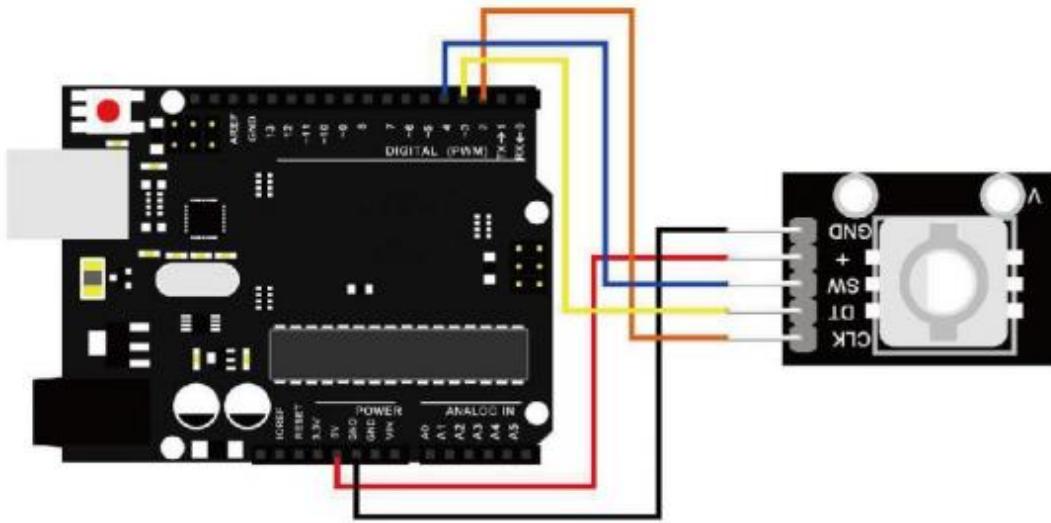

Connection

Schematic

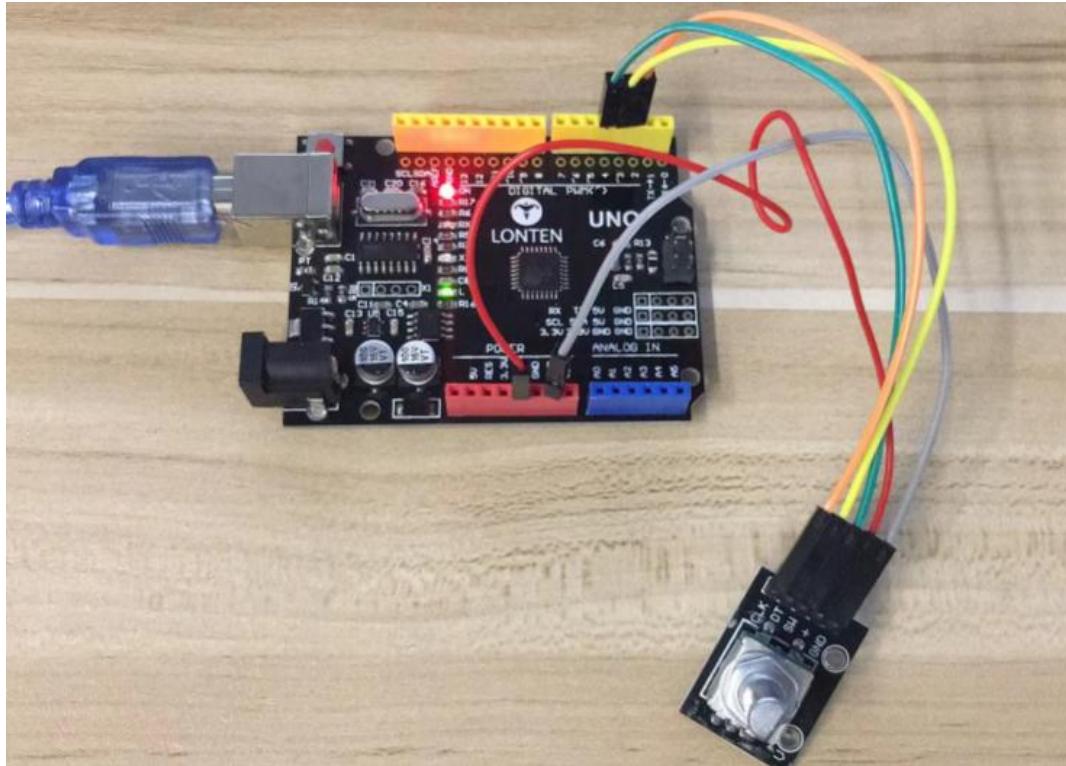

wiring diagram

Example picture

Result

Upload the program, rotate the encodes then open the monitor, we can see the data as below:

Lesson 25 1Channel Relay Module

Overview

In this experiment, we will learn how to use the 1 channel relay module.

Relay is a kind of component when the change of the input variables (incentive) to specified requirements, the output electric circuits of the charged amount occurs due to the step change of a kind of electrical appliances. This company produces the relay module can meet in 28 v to 240 v ac or dc power to control all kinds of other electric parts.

LROBRYA

MCU can be used to achieve the goal of timing control switch. Can be applied to guard against theft and alarm, toys, construction and other fields. Relay is an electrical control device. It has a control system (also called input circuit) and control system (also called the output circuit), the interaction between. Usually used in automatic control circuit, it is actually with a small current to control large current operation of a kind of "automatics.

- 1.GND:ground
- 2.VCC:3.3V-5V DC
- 3.OUTPUT

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) 1 channel relay module * 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Component Introduction

Relay:

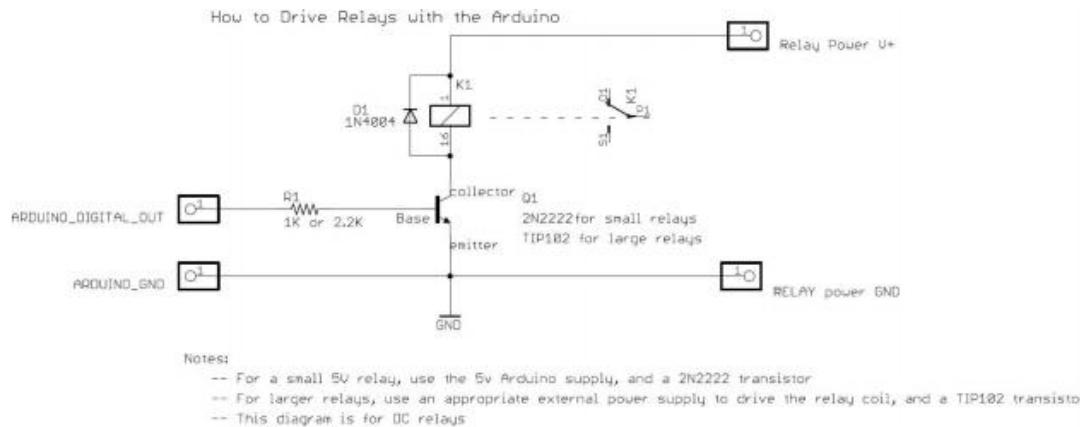

A relay is an electrically operated switch. Many relays use an electromagnet to mechanically operate a switch, but other operating principles are also used, such as solid-state relays. Relays are used where it is necessary to control a circuit by a low-power signal (with complete electrical isolation between control and controlled circuits), or where several circuits must be controlled by one signal. The first relays were used in long distance telegraph circuits as amplifiers: they repeated the signal coming in from one circuit and re-transmitted it on another circuit. Relays were used extensively in telephone exchanges and early computers to perform logical operations.

A type of relay that can handle the high power required to directly control an electric motor or other loads is called a contactor. Solid-state relays control power circuits with no moving parts, instead using a semiconductor device to perform switching. Relays with calibrated operating characteristics and sometimes multiple operating coils are used to protect

electrical circuits from overload or faults; in modern electric power systems these functions are performed by digital instruments still called "protective relays".

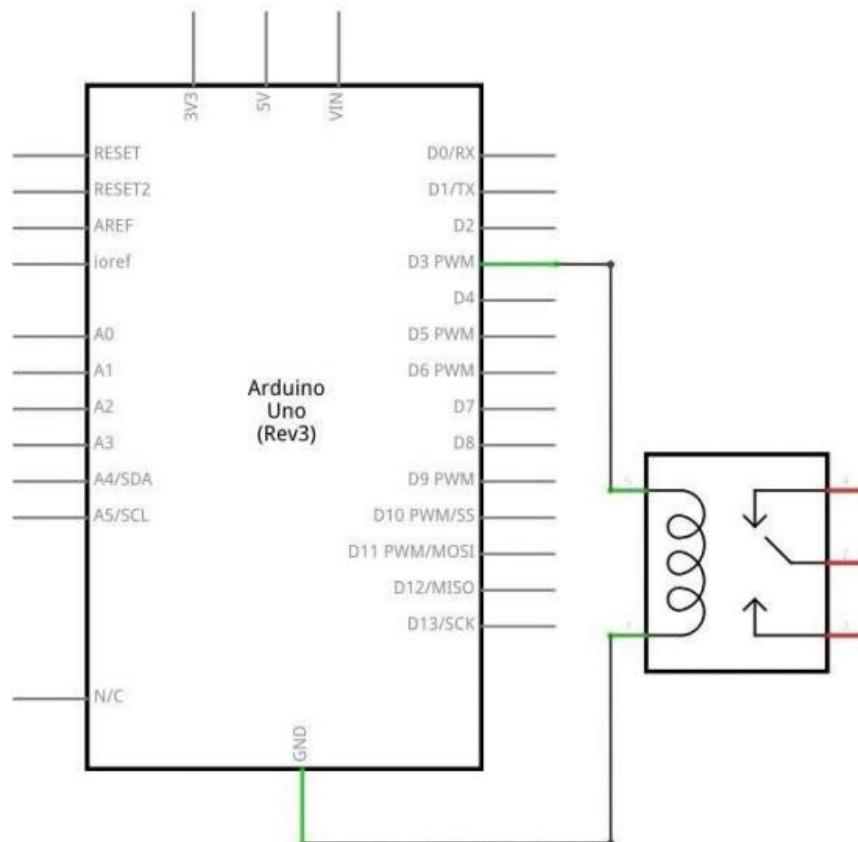

LROBRUYA

Bellow is the schematic of how to drive relay with arduino (down load from the arduino.cc)

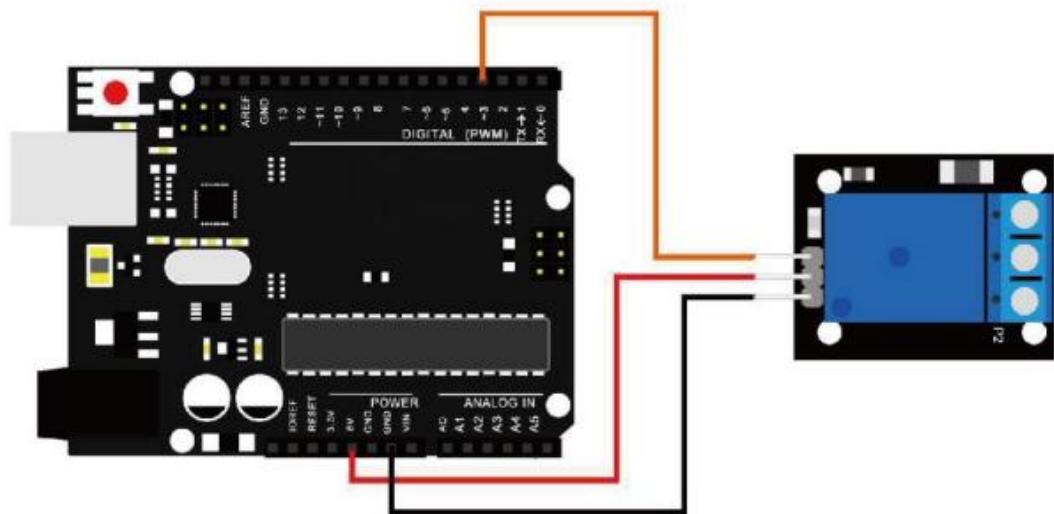

Connection

Schematic

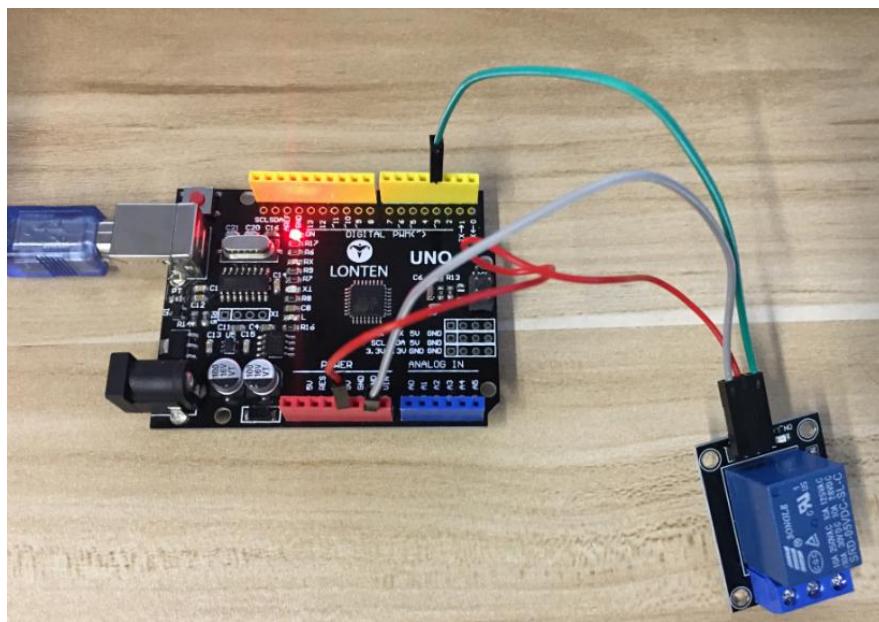

LROBRYA

Lesson 26 Heartbeat Module

Overview

This project uses bright infrared (IR) LED and a phototransistor to detect the pulse of the finger, a red LED flashes with each pulse. Pulse monitor works as follows: The LED is the light side of the finger, and phototransistor on the other side of the finger, phototransistor used to obtain the flux emitted, when the blood pressure pulse by the finger when the resistance of the photo transistor will be slightly changed. The project's schematic circuit as shown, We chose a very high resistance resistor R1, because most of the light through the finger is absorbed, it is desirable that the phototransistor is sensitive enough. Resistance can be selected by experiment to get the best results. The most important is to keep the shield stray light into the phototransistor. For home lighting that is particularly important because the lights at home mostly based 50HZ or 60HZ fluctuate, so faint heartbeat will add considerable noise.

When running the program the measured values are printed. To get a real heartbeat from this could be challenging.

1.GND:ground
2.VCC: 3.3V-5V DC
3.OUTPUT

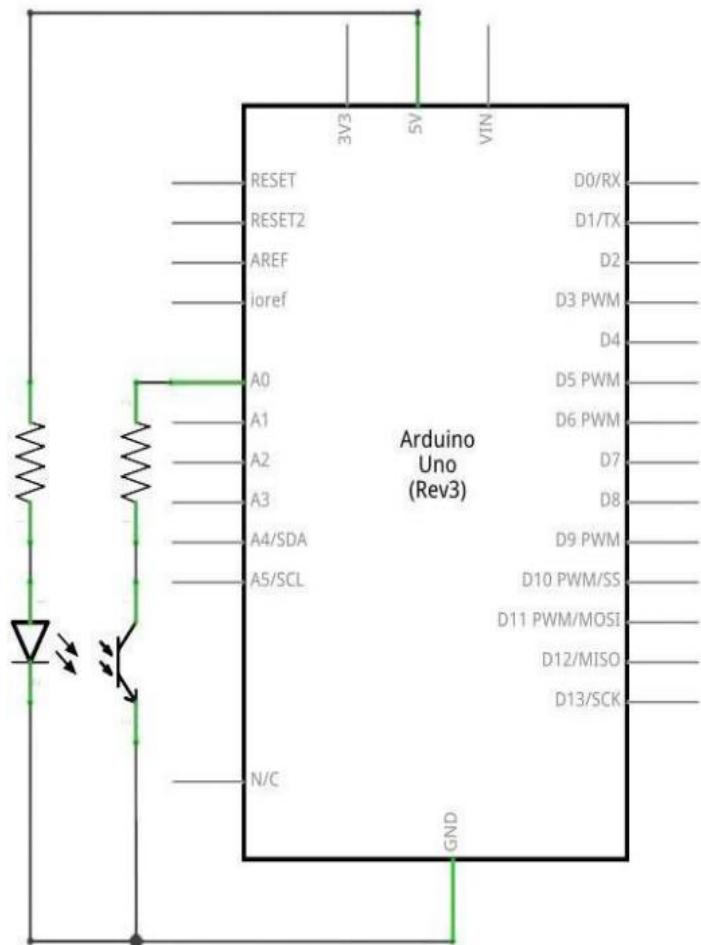

LROBRYA

Lesson 27 HC-SR04 Ultrasonic Sensor

Overview

As the ultrasonic has strong direction, slow energy consumption and far spread distance in the media, so it is commonly used in the measurement of distance, such as range finder and position measuring instrument.

Using ultrasonic is more rapid, convenient, simple to calculate and more easier to achieve real-time control, so it has also been widely used in the development of mobile robots.

Ultrasonic detector module can provide 2cm-450cm non-contact sensing distance, and its ranging accuracy is up to 3mm, very good to meet the normal requirements. The module includes an ultrasonic transmitter and receiver as well as the corresponding control circuit.

LROBRYA

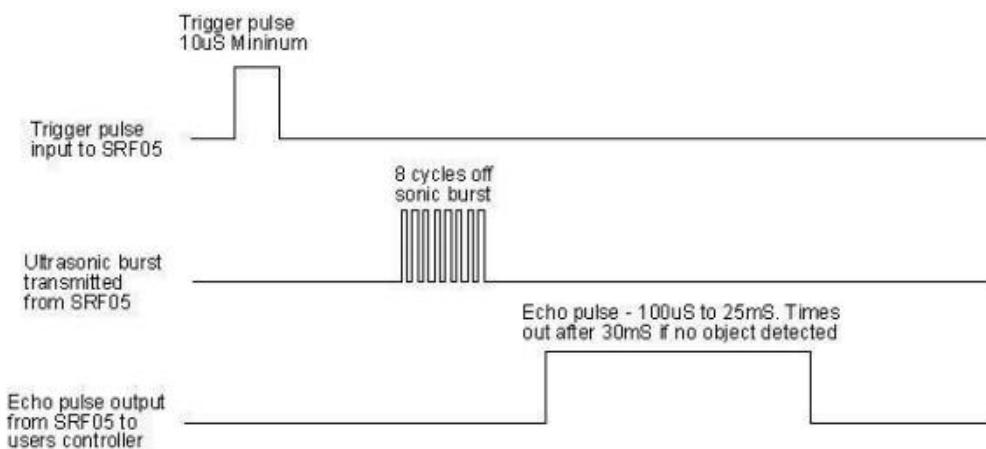

Component Required:

- (1) LONTEN UNO Board * 1
- (2) USB Cable* 1
- (3) Ultrasonic sensor * 1
- (4) Breadboard* 1
- (5) Breadboard Jumper Wires* Several

Working Schematics

Please refer to the working sequence as below:

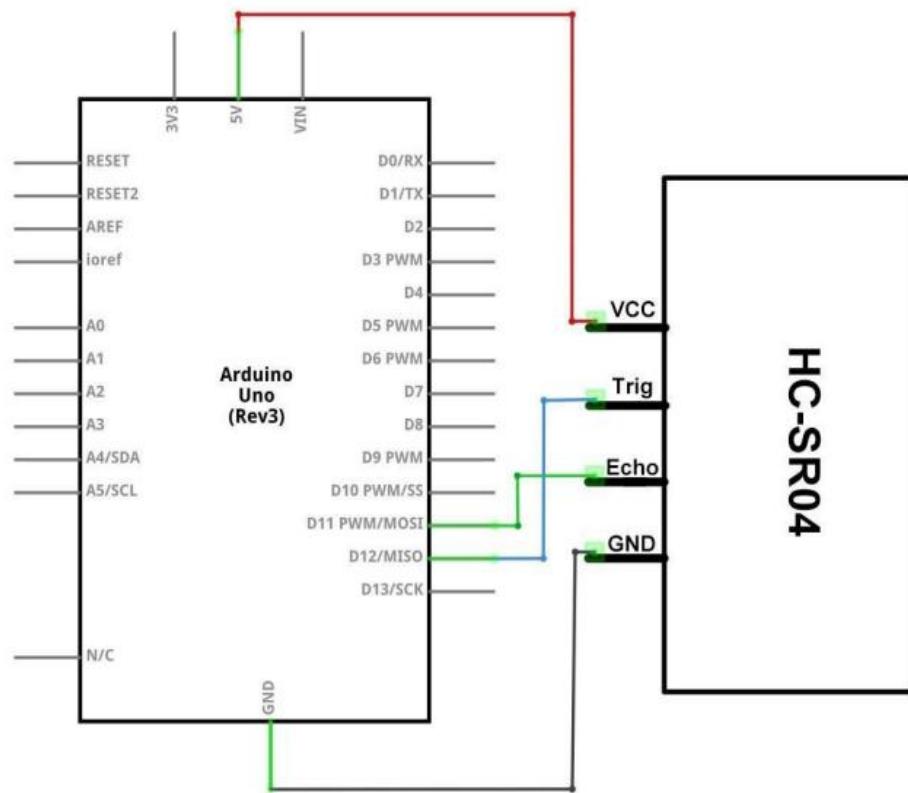

-
1. First pull down the TRIG, and then trigger it with at least 10us high level signal;
 2. After triggering, the module will automatically transmit eight 40KHZ square waves, and automatically detect whether there is a signal to return.
 3. If there is a signal returned back, through the ECHO to output a high level, the duration time of high level is actually the time from emission to reception of ultrasonic.

Test distance = high level duration * 340m/s * 0.5.

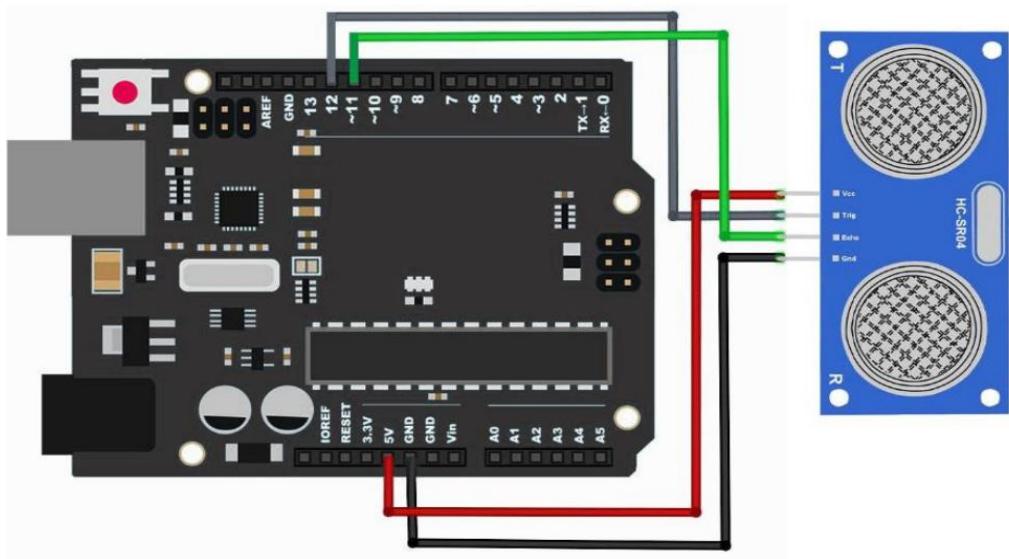

Connection

Schematic

LROBRUYA

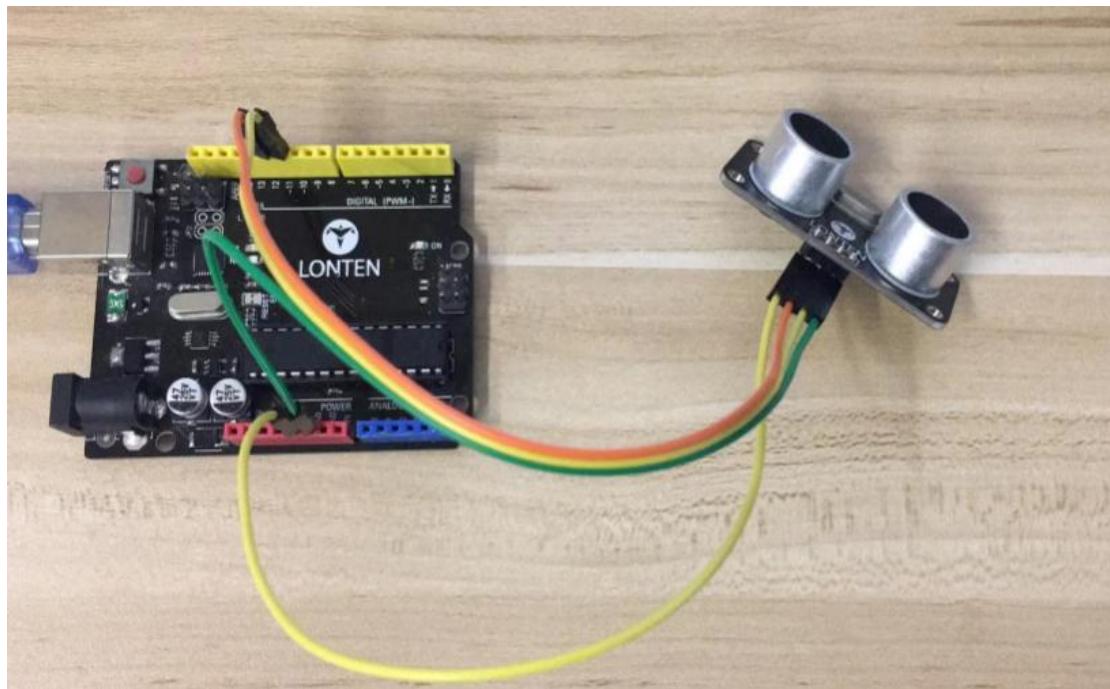

wiring diagram

LROBRYA

Example picture

Result

Using a Library designed for these sensors will make our code short and simple. We include the library at the beginning of our code, and then by using simple commands we can control the behavior of the sensor.

[After wiring, please open the program in the code folder- Lesson 27](#)

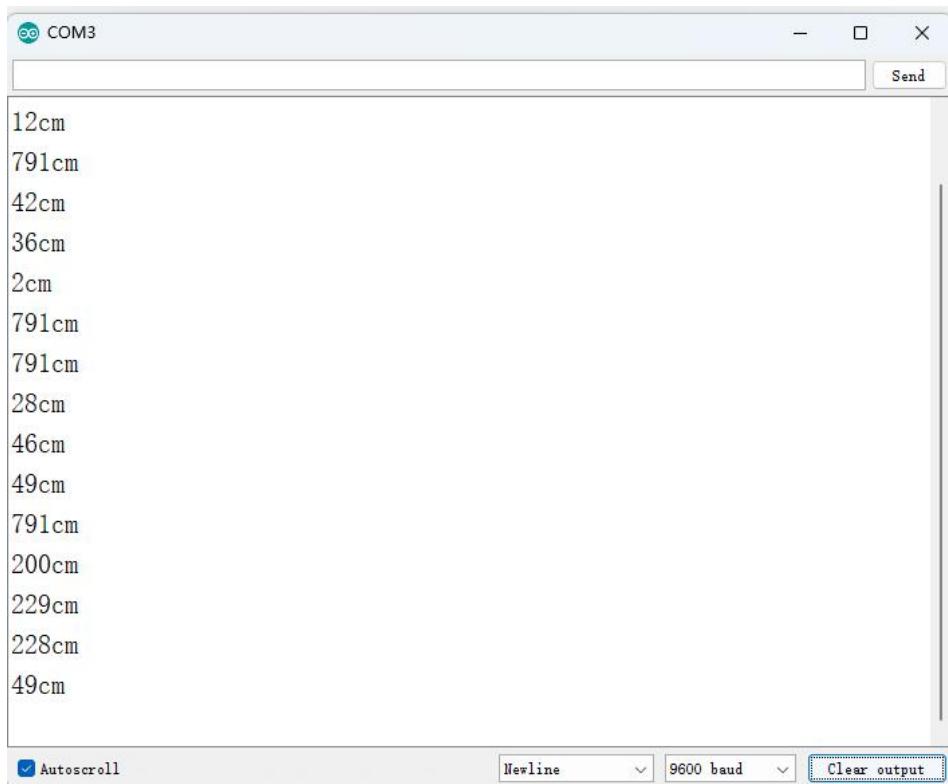

[HC-SR04 Ultrasonic Sensor and click UPLOAD to upload the program.](#)

[Before you can run this, make sure that you have installed the](#)

[`<HC-SR04>` library or re-install it, if necessary. Otherwise, your code won't work.](#)

Open the monitor then you can see the data as blow:

LROBRUYA

A screenshot of a terminal window titled "COM3". The window displays a list of sensor readings, each consisting of a value followed by "cm". The readings are: 12cm, 791cm, 42cm, 36cm, 2cm, 791cm, 791cm, 28cm, 46cm, 49cm, 791cm, 200cm, 229cm, 228cm, and 49cm. The terminal window includes standard controls like "Send", "Autoscroll" (checked), "Newline", "9600 baud", and "Clear output".
